Careful analysis of the community served, its needs and possibilities will frequently open up new and profitable avenues of trade. The dealer should be a good roads and better farming enthusiast with prices on live stock where they have been for the last decade. Stock raising is not only much more profitable than grain farming but the stock raiser is a heavy consumer of lumber. Material is needed for barns, sheds, feed yards, feeding racks and bunks. Whatever helps to develop stock raising and its attendant increase in profits to the farmer also leads to more sales of building material and a corresponding profit to the lumberman. Then there is the matter of too many yards in a given territory which must be settled by lumbermen or have the matter settled by others.

I have not attempted to cover the whole field of profit making and expense reduction but have endeavored to touch upon some common place, but nevertheless important means of bettering the business.

Pocket planers should be used wherever the business will justify

and profitable lines should be pushed of course. Specialties where they do not require too much effort and pay a good return may well be given attention. Especially is that true where their sale means more and better business.

Almost every suggestion made depends upon the yard manager for its development and perfection. He is largely responsible for the business being what it is. He must be an all round business man with very complete knowledge of credits, materials, grades and methods. He is his customer's advisor and friend. The business fails or succeeds as he fails or succeeds. To be sure, some men would not get by in the best possible situation and with the best training while others succeed in any situation. However, the man who surmounts every difficulty makes his greatest success where his training has been thorough and complete and where the system he follows is the best. Here's to him. May his outstandings be low and his profits correspondingly high.

The Live Lumber Yard

A number of interesting addresses were delivered at the recent meeting of the Northwestern Retailers' Association. One of these, which was made the subject of much discussion by those present, was an address by E. W. Mayer, who talked about "The Live Lumber Yard." As a result of some remarks which he had heard at a previous meeting, he had decided to advertise his yard as a "Live Lumber Yard." The address which he delivered was an explanation of his methods of advertising. "No doubt the value of having a good name is the biggest asset a yard can have," he said. When a customer calls, he usually makes up his mind to one of two things, that a yard is either a poor or a good one. In order to give our trade no chance to class us among the poor ones, we have laid down these rules, and stated briefly, they are: Our customers will always find us at work; Our ads will change every week; Our bookwork shall always be up-to-date, and Our lumber piles always in order.

The fact that a customer always finds the yard manager and yard help at work, gives a strong hold on his trade. People like to trade with the man who is busy. Friendship and salesmanship are all very well to bring business, but if you are known as a hustler people will trade with you who might never do so if you were to depend on their friendship. During dull days, my helper, who is a carpenter, makes such things as hog-troughs, hayracks and the like. Whenever I find no other work to do, I make a round of the slow paying customers.

By our policy in changing our ads every week we make another strong bid for being known as a progressive yard. By the use of an ad clipping book, this part of our work is made easier. In this book we keep a copy of all our own ads and also other ads that we run across which we think may give us some ideas for a future ad. Our ad clipping book is a fund of ideas always at hand to help us when hard pressed to write an ad.

In writing our ads, we make as complete a change of copy each week as possible, and never allow our printer to set up our ad. the same way every time. Very often we do not say anything about lumber.

I will read you two ads, which we have used to show how we endeavor to interest people so that they will look up our ad. each week. The first ad. has the head line, "Do You Know?" and underneath in separate paragraphs this:

That the richest land in the state is right here at Triumph?

That if you emigrate the chances are two to one you will come back?

That the average person is richer, healthier and happier in this county than the average person anywhere?

Probably you are putting off building, why not have all those advantages you are looking forward to now? You know you are here but a short time and a long time somewhere else. Yours in a hurry.

THE LIVE LUMBER YARD

The second ad. has simply the head line "1913" and the following subject matter:

Do you realize that neither the Democrats nor the unlucky number "13" seem to be able to stop this busy building year of 1913? Everyone is planning and boosting, buying and building.

However our yard has been "Johnny on the spot" with material when wanted.

The year 1913 still finds us without having a delayed job. As the busy season is coming on, our yard, the largest stocked yard in this county is well prepared to serve you.

A plan we use to keep in touch with the lumber needs of our customers is, whenever we can, we find out ahead of time which of our customers intend to build or make repairs and make a memorandum, of all the information, in a book for this purpose. When the time is ripe to sell the lumber we send the prospective builder a letter reminding him of our desire to secure his trade. We have three separate letters ready to use for this purpose. Each of the letters is different from the others and we keep sending them until the customer buys his bill.

Converting the Slabs

The best way to convert slabs of pine and soft wood, or any other wood for that matter, is to first determine the produce they are to be converted into and then follow whatever method makes the shortest and best route to that end. In some of the work, however, there is a choice of several methods, and sometimes it is a little difficult to decide which is best or most convenient. In converting slabs into short length lumber, box shooks and things of that kind, there is a choice between using the old circular slab saw and the modern horizontal resaw and also between sawing the slabs full length and slicing them up into short lengths before working.

The old circular slab saw was and is still offered in various sizes and for working slabs of varying lengths. It seems, however, that the preferable order of business is to cut slabs into comparatively short lengths. Even if the slasher is not used, the feathery end is cut off generally with a cross-cut saw and only the thick part of the slab made use of.

It is seldom that slabs are thick all the way through, thick enough to make lumber or box shooks. It is usually a swell in the end or a bow in the centre of the log that makes a heavy place in the slab, and in either case the light part of the slab might as well be cut away first as last, unless it increases the task of handling the heavier part that does contain some good stock.

Then, the short length of slab can be worked on a short log special mill for this purpose with a circular saw, or it might be handled with the modern type of horizontal resaw.

This is one point of advantage of the horizontal resaw over the old type. The standard upright resaw generally has rolls between which the lumber is fed for resawing and it generally presumes on the lumber being uniform in thickness and not slabs with only one face. It is, of course, practical to rig a slab carrying outfit to an upright resaw and resaw slabs in this way.

The horizontal resaw offers a simple method of handling slabs, however; that is, the horizontal band resaw. With a flat feeding bed it offers a natural rest for the face side of the slab, and whatever thickness of stock is wanted can be sawed off and the slab returned until it is worked down and every bit of good stock in it obtained.

Whether the slabs are worked up right at the tail end of the mill as they are made, or the slab converting department is made a separate institution off to itself, the preferable time to work slabs is while they are fresh and green. This is true, too, of cull timbers and parts of framing and other stock that it seems best to work up into box shooks and short length lumber. It is not always practical to work them green and it is possible to work them when they are half dry, but the work is nicer and the results better if all of this stock can be handled while it is comparatively fresh.

It is perhaps better, too, if one can operate this slab converting business independently of the regular flow of the lumber through the mill. No matter whether the slabs are trimmed up on a regular cross-cut or run through a shaper, let them go on out of the mill and set this slab converting department to one side down below, or somewhere so as to get it all out of the way and free the mill itself of any encumbrance that might interfere with the regular running.

In a way this is pretty much the same order of business as making shingles as a side issue to a cypress mill, where certain block or timbers are cross-cut and sent to a separate department for conversion into shingles.

It may be practical in some mills, and desirable, to put some type of resaw right in the back end of the mill so as to handle the slabs and reduce them to some special thickness of lumber just as they come from the mill and save the extra handling required to run them off to a separate place. It depends somewhat on the character of the work it is desired to follow. If one has a call for shooks or other stock running uniform as to thickness and the run of slabs is fairly regular, one may be able to arrange either a modern horizontal resaw or a circular slab saw so that it can be operated practically as a part of the mill, just as the edger and trimmer and other mill floor equipment is operated. Then let the stock from this resaw be taken to its proper place and either piled and dried before trimming up, or be trimmed and converted into shooks, whichever is the order of the day.

Where this scheme can be carried out successfully it is probably the most economical method for converting slabs. It keeps them cleaned up all the time and saves handling and the accumulation of piles now and then. It has the one disadvantage, however, that it is inconvenient for bringing stock back out of the yard stock or cull timbers and framing, and things of that kind, that may need handling through the same system.

Other mills, of course, will find it more advantageous to do the extra handling and make this slab converting business a separate institution from the mill, and perhaps combine it with a shook or crate making compartment.—St. Louis Lumberman.

EDGINGS

Ontario

The sawmills and office of Foley Bros., at Foley's Lake, Ont., near Sudbury, were completely destroyed by fire on February 23rd.

The McAuliffe Davis Lumber Company, Limited, Duke Street, Ottawa, have secured the contract for furnishing the city with lumber for which it recently called for tenders.

West & Jackson, Tilsonburg, Ont., are seeking information regarding the best class of flooring and woodwork to use in the new library building. Details of the materials required can be secured on application to West & Jackson.

John Harrison & Sons, Owen Sound, Ont., started operating their sawmill day and night on March 2nd. The company have a large quantity of hardwood logs in the yard, which they intend to cut, so as to have them out of the way before the rafting season commences.

The Classic Furniture, Limited, has been incorporated with a capital of \$200,000, with head office at Stratford, Ont., to carry on business as furniture manufacturers. The provisional directors are G. McLagan, D. McK. Wright, J. G. Davies and H. S. Robertson, manufacturers, all of Stratford, Ont.

The London and Petrolia Barrel Company, Limited, has been incorporated with a capital of \$500,000, with head office at London, Ont., to carry on a cooperage business. The provisional directors are J. P. Forristal, manufacturer; Sir George Gibbons, K.C., and G. S. Gibbons, barrister, all of London, Ont.

The John C. Gilchrist Lumber Company, Limited, has been incorporated with a capital of \$200,000, with head office at Toronto, Ont., to carry on business as lumber merchants. The provisional directors are J. C. Gilchrist, G. H. Gilchrist, and S. M. Gilchrist, lumber merchants, and G. C. Paterson, all of Toronto.

The Canadian Handle Manufacturing Company, Limited, London, Ont., whose factory at Strathroy, Ont., was recently destroyed by fire, report that they intend to rebuild as soon as conditions are favorable. The new plant will be much larger than the old one and the sawmill will be in a separate building from the factory.

The Canada Pole and Shaft Company, Limited, has been incorporated with a capital of \$400,000, with head office at St. Catharines, Ont., to carry on business as manufacturers of poles, shafts and vehicles of all kinds. The provisional directors are J. K. Kernahan, J. S. Campbell, and Vernon Moyer, all of St. Catharines, Ont.

The Northern Ontario Pulp and Development Company, Limited, has been incorporated with a capital of \$150,000, with head office at Toronto, Ont., to carry on business as pulp and paper manufacturers. The provisional directors are H. E. Manning, B. H. L. Symmes, R. H. Green, P. W. Beatty and W. L. L. Gordon, all of Toronto, Ont.

The Bertrand Lockhart Lumber Company has been incorporated with a capital of \$75,000, with head office at Port Arthur, Ont., to carry on business as lumber merchants, etc. The provisional directors are A. G. Beaman, J. H. McLennan and J. P. Bertrand, lumbermen; H. A. McKibbin, financial agent; and W. Marrigan, contractor, all of Port Arthur, Ont.

Sealed tenders are being received up to March 18th, at 12 o'clock noon, by F. C. Clarkson, 15 Wellington Street West, Toronto, for the purchase of the goods of the H. & A. Ogilvie Company, Limited, Kelso Mines, Ont., including a sawmill and equipment in the township of Walker, one and one-half miles from Monteith Station on the T. & N. O. Railway. The mill is located one-half mile from the tracks and is 24 x 90 ft., of two storey frame construction. It is valued at \$5,200. Tenders are also being received for 80,000 feet of lumber and 180,000 feet of logs.

The Windsor Lumber Company, Windsor, Ont., acquired five acres of ground with railroad sidings on Wyandotte Street and Cameron Avenue, and will operate a wholesale and retail lumber business. It will have ample facilities for handling lumber economically and will carry a large, diversified stock ready for immediate delivery, and will install machinery for manufacturing special work. James C. Scofield, formerly of Woodstock, is manager of the company. He is especially well known through his ten years' connection with the Paine Lumber Company, of Oshkosh, Wis. The Windsor company is expected to be ready for business early in the spring.

Eastern Canada

La Compagnie J. P. Dupuis, Limitée, lumber dealers, Montreal, P.Q., has been registered.

The Montreal Pile Driver Lumber Supply Company, Montreal, P.Q., has been registered by Euclide Cote and Donat Cote.

Kirk & Cook, contractors, North Sydney, C.B., are reported to be in the market for a quantity of cedar poles and timbers for their railway construction work.

The Thos. Bell Lumber Company, Princess Street, St. John, N.B., recently secured a contract for furnishing the city with a supply of lumber for which it called for tenders.

Pulp and Lumber Limited, has been incorporated with a capital of \$100,000, with head office at Montreal, Que., to carry on business as pulpwood and lumber manufacturers. The provisional directors are H. Lampard, engineer, of Westmount, Que.; H. M. G. Bellevue, and B. C. Bellevue, of Montreal, Que.

La Compagnie Electrique Des Rivières has been incorporated with a capital of \$40,000, with head office at Notre-Dame de Stanbridge, Que., to carry on business as a power company and manufacturers of furniture, sashes, doors, etc. The provisional directors are H. Renaud and A. Bombardier, of

Notre-Dame de Stanbridge, Que.; A. Desautels, Saint Gregoire, Que.; A. Fournier, Notre-Dame de Stanbridge, Que., and A. Lemire, Lachine, Que.

La Compagnie Industrielle de Joliette, Limitee, has been incorporated with a capital of \$12,000, with head office at Joliette, Que., to carry on business as lumber manufacturers, etc. The provisional directors are Z. Bacon, C. Ladouceur, N. Boucher, manufacturers, and Louis Trudel, joiner, all of Joliette, Que.

At a meeting of the bondholders of the Ouitachouan Falls Paper Company, which was held in Montreal last week, arrangements were made for the transfer of the former company to the Chicoutimi Pulp Company, of Chicoutimi, Que., who already owned a controlling interest, so that the two concerns are now operated as one.

The St. Lawrence Pulp & Paper Company, Gaspé, Que., have awarded a contract to the Canadian General Electric Company for the supply of two 1,000 kw. turbo-generators. The Structural Steel Department of the Canadian Allis-Chalmers, Limited, will also supply the steel necessary in the erection of the pulp and generating buildings at present under way.

The Quebec Harbor Commissioners are calling for tenders for the supply of square hewn spruce timber, to be delivered during May, June and July next. The timber is not to have more than 1½-in. of wane. It must be sound, straight and free from cross gum seams, and must be 18 ft. and up in length, the average length to be not less than 24 ft. Twenty per cent. of the total quantity is to be from 10 x 10 in. up to 11 x 11 in. The remainder is to be from 11 x 12 in. up to 13 x 13 in. Delivery is to be made at Indian Cove or at the Louise docks, as may be directed.

The Bathurst Lumber Company, Bathurst Village, N.B., have completed plans for the erection of a fifty-ton sulphite pulp mill at Bathurst. Work will be commenced at once, the organization having been completed already. The plant will be in a position to place its paper upon the market by May 1st, 1915. The output will be the highest grade of thirty-hour cook sulphite, bleached electrolytically. The mills will be operated under the name of the Bathurst Pulp & Paper Company, Limited, with a capitalization of \$3,000,000. Mr. Angus McLean, general manager of the Bathurst Lumber Company, will be president of the new company, while A. G. McIntyre, former editor of the Pulp and Paper Magazine and superintendent of the Forest Product Laboratories, a recent graduate of McGill University, will be the manager. The mill is to be situated on Bathurst Harbor and the Nepisguit and Tete-gauche rivers, which empty there, contributing materially to the economical operation of the plant, which is also favored by the vicinity of adequate transportation advantages and a good labor market. The Bathurst Lumber Company owns 2,800 square miles of limits extending from the plant itself.

Western Canada

The A. J. Burton Saw Company, New Westminster, B.C., lost its plant by fire recently.

The Alberta Lumber Company, Limited, has increase its capital from \$50,000 to \$200,000.

The Northwest Lumber & Commission Company, Limited, Winnipeg, is applying for permission to increase its capital stock from \$20,000 to \$100,000.

The Shushartie Lumber Company, Limited, has been incorporated with a capital of \$250,000; with head office at Vancouver, B.C., to carry on business as lumber merchants.

The Vancouver Cedar Mills, Limited, has been incorporated with a capital of \$750,000, with head office at Vancouver, B.C., to carry on business as timber merchants, etc.

The Canadian Wood Distilling Company, Limited, has been incorporated with a capital of \$100,000, with head office at Cranbrook, B.C., to carry on business as distillers, wood preservers and lumber merchants.

The Westminster Woodworking Company, Lulu Island, New Westminster, B.C., has lost its plant by fire. The loss, which included equipment and three freight cars on a siding, totalled \$75,000. Damage to the plant and stock amounted to \$47,000, with insurance of \$40,000. The plant will be rebuilt at once.

The Brooks-Scanlon Lumber Company, of Vancouver, has bought the shingle mill at Burrard Inlet of the Howe Sound Timber & Logging Company, of which C. S. Roray is president. The latter company will develop its limits on Dakota Creek, and if the shingle market continues to improve they will erect a mill.

Moose Jaw, Sask., capitalists have organized the Kootenay Mills Limited, to take over the sawmill and sash and door factory at Kaslo, Kootenay Lake, formerly operated by the W. E. Cooke Lumber Company. J. W. Sifton, president of the Executors & Administrators' Trust Company, Moose Jaw, is president; R. H. Fulton, general manager of the Bank of Saskatchewan, secretary and treasurer. Fire burned out the two operating mills on Kootenay Lake, and the new concern at Kaslo should find considerable local business.

Some exceptionally interesting logging work will be carried on during the coming summer upon scrub lands on the outer fringe of North Pacific Islands. The timber on these areas is mainly pole cedar. This will be a new industry for the north and the local conditions will probably call for the exercise of considerable ingenuity in connection with the methods adopted. The ground is soft and marshy in most cases and will not permit of the use of horses. The timber, moreover, is too light for the profitable working of the regulation steam "donkey."

Sealed tenders are being received by the chief forester, Victoria, B.C., until noon on March 26th for the purchase of license X126, to cut 1,355,000 feet of Douglas fir and cedar on an area adjoining P. R. 2330 Pendrill Sound, New Westminster district. Two years will be allowed for removal of the timber. Tenders are also being received until noon on April 20th for the purchase of license X129, to cut 4,760,000 feet of Douglas fir, hemlock and cedar on an area immediately west of lot 105 Valdes Island, Okishollow Channel. Two years will be allowed for the removal of the timber. Tenders are also being received until noon on March 26th for the purchase of license X101, to cut 1,354,000 feet of Douglas fir, cedar and hemlock on an area adjoining Lease Lot 24, Range 1, Coast district, located on Mayne Passage. Two years will be allowed for the removal of the timber.

Are You Protecting Your Profits

or are you indifferent to the fact that they perhaps are being consumed by unnecessary expenses?

Do you consider transmission troubles, power losses, and shut downs for repairs as being natural occurrences in a Saw Mill or Planing Mill? Are you endeavoring to get to the root of these troubles, or are you of the belief that they cannot be helped?

These all too common and unnecessary expenses are largely due to the use of belting which is incapable of meeting the exacting conditions under which it has to work. NEPTUNE and SPARTAN Leather Belting will not only protect your profits but will assist greatly to increase them. These two brands will give the maximum power transmission throughout your plant and will outwear any ordinary belting used under the same conditions.

Neptune and Spartan Belting is backed by sixty-three years' belt building experience and a thorough knowledge of the conditions under which belts have to be used. This knowledge has enabled us to produce in the NEPTUNE and SPARTAN Brands, belting which has proved to be unequalled for the efficient and economical transmission of power.

Why not investigate the superior qualities of Neptune and Spartan Belting?

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Our catalogue fully explains

Ryther & Pringle Co.

Carthage, N. Y.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

GOODHUE BELTS
J.L. GOODHUE & CO. Limited.

DANVILLE — QUEBEC.

A New Saw Sharpener

United States Patent For Sale

This new and adequate saw sharpener is designed to give a keen cutting edge to the saw teeth.

No part of the mechanism is interfered with by emery dust. Every provision is made to enable this machine to do its work, thoroughly, quickly and accurately.

The sharpener was invented in Canada by us and at present we are sole manufacturers. It is patented in Canada and the United States. The patent rights for the latter country are for sale. If you are interested write us for further particulars.

Breeze, Denison & Company, Newburgh,
Ont.

WHEN RIP VAN WINKLE DID AWAKE HE WAS TWENTY
YEARS BEHIND THE TIMES.

Men of his type engaged in the lumber business never use a Seventy-Seven Planer and Matcher; but if you will consult the Red Book you'll find that those fellows who hang onto slow and antiquated planing mill methods are the ones who drop out of that book, because, of course,—they drop out of business.

There are hundreds of 77's in the mills of the South and West and elsewhere, and every machine is a marked success—and not only that, the firms employing 77's are successful.

These are actual facts--subjects for serious reflection.

Let us send you a catalogue of the "77" Model 5.

Incidentally, did you ever hear of a "77" for sale on a second-hand list? you never did.

Locomotive Boiler on Skids

Atkins' Inserted Tooth Cutoff Saw

McLean Pattern

A sensation in the Saw World. The smoothest cutting saw. Requires less hammering. Wears longer. Necessary set is in the teeth. No change in diameter of Saw. Teeth do not break out. Short teeth, holds Tension. Made in sizes from 20 to 86½ inches. 9 to 5 gauge.

Order now if you expect shipment within sixty days.

Our capacity already overtaxed. Manufactured exclusively by

E. C. Atkins & Company

Makers of Sterling Saws

Factory, Hamilton, Ont.

Vancouver Branch, 109 Powell St.

PEAVIES

Cant Hooks, Boom Chains, Timber Dogs

It is time to think about your logging equipment for the ensuing season. Let us figure on your requirements for Peavies, Cant Hooks, Timber Dogs, Boom Chains, and Shackles, Mill Chains, Forged Steel, Log Stamping, Hammers, etc.

Our products are the result of over 50 years of careful study of the lumberman's requirements and we can offer the best equipment at the lowest price.

ARGALL BROTHERS Three Rivers, Quebec

MERRITT MFG. CO., Lockport, N.Y.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

What I Can Do For The General Planing Mill

You don't have long runs on a few kinds of patterns, the kind that requires a "333" — your work is mostly short runs, different kinds, different sizes, different patterns—the kind that need me. Here's what I can do for you:

1. I will take care of all your matching and sizing up to 24" x 8".
2. I will do all your double surfacing up to my full rated width.
3. I will run all the flooring you need.
4. I will serve you as an inside moulder carrying formed cutters up to 1 1/4" projection.
5. I am readily accessible in every part, so that changes can be made quickly, easily and economically.
6. I have all the conveniences, all the time-saving adjustments and all the grade-raising value of the latest fast-feed matchers.
7. I have a mechanically perfect drive that makes every ounce of power count.
8. I run at a low operating cost, both for power consumed and upkeep expense.
9. I am medium in weight and size.
10. I am also medium in price, so that any mill can afford to put me in.
11. I am making money—big money—for hundreds of successful planing mill owners, men who, like you, are operating a general purpose mill.
12. I will do the same thing for you.
13. I invite you to write today—now—to my designers and builders.

J. A. FAY & EGAN CO.

465-485 W. Front St., Cincinnati, Ohio, U. S. A.

Potato Scale Boiler Cleanser

This compound is a deadly enemy to scale and not only removes scale from tubes but if used regularly in the feed water prevents the formation of scale.

It contains no ingredients that can in any way harm metal.

Potato scale is sold under a guarantee—thousands are using it and are perfectly satisfied. Write for sample keg.

C. C. Snowdon

Box 1384

Calgary, Alta.

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

The wheel that holds its shape—
keeps a free cutting face—is the
wheel that holds its place in the
sawmill.

Aloxite Saw Gumming Wheels

Are helping the filers in the big
and little mills almost every-
where to better saw service—
better gummed saws in less time.
They cut free, fast, and cool—they do
not case-harden the saw—you can feed
them right into the gullet as fast as you
will, and they stand up on the job.

A trial wheel will show you their real efficiency

THE SHIMER CUTTER HEADS

Quality Machine Work

The planing mill man, furniture worker or any one who uses machines to finish wood products, will always find in the Shimer System of Tools the remedy for mill troubles, the power to increase output and the facilities to make a superior product.

No matter whether your work is Single Matching, Double Matching, Ship Lap, Jointing, making Glue Joints or Door and Sash patterns, if you desire to turn out quality product get the Shimer System in your mill.

Look over this page and then let us have your specifications.

The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628.

**For the
High
Speed
Matcher**

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, \$72.46 the set complete.

**The Shimer
Combination
Head for Door,
Sash, Blinds and
Mouldings**

The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day. Where a mill runs on stock or has much work to do we advise running the Shimer Heads with Circular bits on account of the greater wear and the fact that the Heads are always ready to be slipped on the spindle.

This particular outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads with Door Cope Bits and two Sash Cope Bits for the lower Door Cope Head. The outfit is sent complete for the low price of \$47.31.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. There are no complications to puzzle or annoy operators. As the Bits are moulded on the back at an angle, they work with perfect clearance and maintain standard patterns. Bits can also be adjusted for different thicknesses of Door and Sash mould.

This Head is very strong and durable and with its combinations is applicable to every class of work. It will take Bits to make Door, Sash and various other mouldings and these Bits are quickly and accurately changed and adjusted by the use of a gauge.

We guarantee these tools to be of the best material and workmanship, and will send them on 30 days trial to any responsible lumberman returnable if not satisfactory.

Send measurements at once.

Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1 1/2-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench ... \$40.95

Extra Bits for Flooring ... 11.44
Extra Bits for Ceiling ... 10.40

With 4 Bits to each Head

Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1 1/2-in., net only ... \$31.20
Extra Bits 1 1/2-in. face, the set ... 10.40
Extra Bits, 2-in. face, the set ... 12.48

O. G. Batten Heads

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only ... \$31.98
Extra Bits, each, net ... 2.08

Double Ceiling Heads

Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net ... \$40.94
Extra Bits, per set of (8) ... 16.64

Ship Lap Heads

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1 1/2-in. thick, net ... \$34.84
Extra set of Bits ... 11.96

Door, Sash and Coving Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head ... \$10.75
Fig. 84, Expansion Door Head ... 13.35
Fig. 86, solid flange, Sash Head ... 9.75
Fig. 206, Expansion Sash Head ... 12.35
Bits to work 1-in. to 1 1/2-in. Doors, 4 ... 7.28
Bits extra to work 1 to 1 1/2-in. Sash (2 Moulded Bits, \$4.30; 2 Rabbeting Bits, \$2.86) ... 7.16

COPE HEADS

Fig. 83, Cope Heads (2) ... \$12.90
Coping Bits, each ... 1.43

The Shimer Box Board Matching Heads

make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match 3/4 to 1 1/2 inch, \$29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, \$11.05.

Cling-Surface Does It.

The belt in this photograph is 3-ply; it is transmitting 220 horse power; is under a tension of over 1445 pounds on the pulling side; and yet THE TOP SIDE RUNS SLACK.

When this belt was photographed (in the plant of the Wilkes-Barre Light Co., Wilkes-Barre, Pa.), it was pulling 220 horse power. Looks as though it were pulling nothing, doesn't it? Increase the load to 268 h.p., the rated capacity of the generator, or even higher, and it will act equally well—Makes no difference to a Cling-Surface-treated belt—the greater the load the further it lies down on the pulley and pulls, for it is the contact that counts. Treated with Cling-Surface a belt can't slip, especially if it is provided with a fairly liberal arc of pulley contact as above.

The belt isn't made the least bit sticky, but rendered pliable and slipless by the penetrating and lubricating action of Cling-Surface.

But coming back to the Wilkes-Barre plant above, the speed of the fly wheel is 240 r.p.m. and its diameter is 80 inches. The generator is 200 kw., 3-phase, 2300 volt, 60 cycle, and its pulley is 32 inches in diameter. Distance between centres, 24 ft. When the belt was new it was not treated for three months. It became oily and dirty and began slipping. Even the tightener would not prevent slip. Then Cling-Surface treatment began, and they write, "Followed Cling-Surface instructions on first application and since then gave an occasional application with brush. Result—no trouble whatever on account of belting." We have thousands of installations doing equally well.

Send your trial order now. We quote f.o.b. Toronto.

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis., a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

SASH

STICKER

No. 317 Sash Sticker With Boring and Grooving Attachment

A very convenient sticker for sash factories.

For making stiles, bars and mullions in one operation.

Supplied with or without boring and grooving attachment.

This machine is strongly built throughout and the feed is by four corrugated rolls.

The parts are all readily accessible; all adjustments being made from the working side of the machine.

Bulletin No. 317 particularly describing this machine sent on request.

Our moulder catalogue describing the complete line of moulders we build, to be had for the asking.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches
Size Drive Pulley 20 by 10 inches
Feed per Revolution of Saw 0 to 3 1/4 inches
Feed Belt 4-inch Gandy
Largest Diameter Saw 56 inches
Length of Carriages 12, 16, 20 or 24 feet

Width of Carriages 33 inches
Trucks 7-inch wheels and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks C1-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

On Berlin Band Sawing Machinery Are Improvements That Cannot Be Bought Elsewhere at any Price.

WHY BERLIN RESAWS ASSURE LARGER PROFITS

Which kind of a resaw are you operating? A built-for-service resaw that starts readily at 7 o'clock and consistently produces at fast feeds all day? Or one that produces at slow feeds, lacks efficient saw protection, feeding power and convenience of operation?

We want to prove to you that Berlin built-for-service Resaws are the most efficient Band Sawing machines in the World. They are better constructed, better designed. Berlin Resaws assure larger profits because they embody improvements and labor-saving operating devices you cannot buy elsewhere at any price.

Mill men who have used other resaws, now using Berlin, tell us that Berlin Resaws do more and better work, are more easily operated, give less trouble and require less power. Blades on Berlin Resaws endure longer runs at fast feeds, assuring larger profits, because the improved Berlin Knife-edge straining device renders constant efficient protection to the blades under all working conditions.

If you intend to modernize your equipment, or install another rip or resaw, it will pay you to investigate the efficiency and economy of Berlin Band Sawing machinery. There's a Berlin Band for every purpose; for whatever rip or resawing you wish to do. And the Berlin best adapted to your work will do it at the lowest possible cost to you.

Berlin No. 342 Short-Saw Sawmill Resaw

This close-coupled resaw, carrying 64-inch wheels, 8-inch 18-gauge saws, is especially adapted for heavy service in sawmills and planing mills where accurate, fast-feed resawing is demanded.

The short, stiff blade, efficiently protected by our sensitive knife-edge straining device, is fast and stiff in the cut. The "342" has large capacity and powerful feed, and will manufacture accurately sawn lumber from cants and planks at cost that assures profit.

The large-diameter, powerfully-driven rolls open 8-in. inside and 14-in. outside of the saw line. Roll setting with our Pilot Wheel set works is quick and accurate. The variable speed device provides eight speeds of feed from 30 to 200 feet per minute; a range of feed covering every need.

Let us send you complete information regarding the No. 342 and other equally efficient Berlin Resaws. The Band Saw Book illustrates and describes the line complete. We'll present you a copy free, if you'll accept it.

Request It on Your Letterhead.

Whitney Engineering Co., Tacoma, Wash., North Western Sales Agent

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**Economy in Logging Operations**

Fifty years experience has taught us how to build logging and industrial locomotives that will give the greatest amount of power for the lowest fuel consumption.

The simple and sturdy construction of our locomotives is also a notable feature. They are easy to control and economical in repair.

Our Logging and Industrial Locomotives are specially designed to meet the conditions under which they are expected to operate.

We are also builders of stationary boilers suitable for contractors and industrial plants. **Send for specifications.**

Canadian Locomotive Company, Limited, Kingston, Ont.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

The Pioneers

We alone manufacture the Genuine "DUNBAR" Shingle Machines—other machines advertised as such are imitations.

Operating our "Dunbar" Shingle Machine one man will joint and sort from 16 to 45 thousand shingles in a day of 10 hours. Good shingles too.

We are Canada's Pioneer Shingle Machine Manufacturers, and we respectfully solicit correspondence from lumber manufacturers.

DIRECT ACTING STEAM FEED
WITH MODEL "D" VALVES

A STEAM FEED, especially when fitted with our model "D" valves, is such a great time saver over a friction feed that it will make an enormous increase in your lumber production, with no additional labor.

Do not decide that your boiler capacity is too small until you have consulted our engineering department. The power required by our feeds is surprisingly small, and we will **guarantee results** on any installation.

We make these feeds in all sizes, including one for **your** requirements.

SHALL WE SEND OUR BULLETIN? IT'S WORTH WHILE.

An Edger That Is Better

The Waterous New Champion Edger

Built with 40 in., 48 in. and 56 in. edger opening,
carries 22 in. saws, will take cants up to 6 in. thick.

You will not find an Edger anywhere that combines as many advantages as this one. It has all the good points you look for, and then some.

In the first place, it is roomy and open to let lots of light into the working space so that you can get a clear view of the stock as it passes through the saws.

The frame is rigid and sturdy, with the weight carried low, the shaft of large diameter, the bearings long. Every part that has work to do is provided with posi-

tive easily reached adjustments for taking up wear.

The saw guides, perfectly rigid when set, shift easily and positively to correct cutting position. Feed rolls are power driven, press rolls swing with the feed. There is no fear that the stock will jam in the rolls or that a 6" cant will not go through the saws.

The fastest mills in Canada are using the New Champion Edger with splendid results on all kinds of timber. It is built to stand up to hard work—will take all you can give it and ask for more.

Let us tell you more about it in the catalogue—No. 113. A post card will do.

Will be sent upon request. Write for Discounts.

WE ANNOUNCE THE FIR DOOR

This door, lately introduced from the West, is justly popular because of its adaptability for a variety of oil finishes. It matches Georgia pine trim perfectly, and can be stained to match various hardwoods, Chestnut, Oak, Ash, etc.

We believe that the Fir Door is going to be "The Door." In line with our policy of Progress, we manufacture it, and are the first Eastern firm to do so. We lead,—watch the others follow us.

This places the Fir Door within reach of all consumers in the East, as we carry a large stock in fourteen different stock sizes, and can make odd sizes for prompt delivery at short notice.

Our new Door Catalogue gives full particulars.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

ADAMS

COAL-OIL POINTERS

A big advantage of the Adams Pointer is that coal-oil may be used as fuel instead of gasoline. This oil is found in every camp in the country, it is cheaper, safer and more convenient than gasoline and is just as satisfactory.

Adams Pointers reduce your river costs.

Adams Pointers do the work of from six to ten men. One man operates all machinery.

Adams Pointers carry your men to work and leave them fresh for the day's work.

Adams Pointers draw themselves over rapids and portages.

Adams Pointers can be used for warping and sweeping logs out of corners that an Alligator could not reach.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 16-ft. Slash table. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |
| | 1 24 x 36 Slide Valve Engine with 40-in. x 12-ft. extra heavy double arm split fly wheel. |
| | 2 Double Duplex, high pressure Water Pumps. |
| | 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| | 2 125 h.p. Water Wheels. |
| | 1 Upright Engine for sawdust conveyor. |
| | 1 10 h.p. Engine. |
| | 1 Mitts & Merrell Hog. |
| | 1 Wood Machine for 22-in. wood. |
| | 1 Wood Machine for 16-in. wood. |
| | 1 Edger for ripping dry lumber, installed. |
| | 1 Edger for ripping dry lumber, not installed. |
| | 1 30 h.p. Generator, 250 volt. |
| | 1 30 light arc generator. |

POWER PLANT

FILING ROOM

- 1 Automatic Filing Machine for 12-in. D.C. band saws.
- 1 Automatic Grinding Machine for 8-in. S.C. band saws.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and rails and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

Best Footwear for Your Work

PALMER'S "Moose Head Brand"

It represents what we have aimed at producing during our whole history in business—the best oil-tanned waterproof footwear in the world. We select the highest grade Chicago Packer Steer Hides and oil-tan them ourselves by a secret process that produces the finest leather in the world, known as Skowhegan leather.

Palmer's "Moose Head Brand" footwear fits better, looks better, wears better. In making them with a view to unusual wearing qualities, we have not overlooked the important points of appearance, fit and comfort.

Write for booklet to-day. Free to you by return mail.

John Palmer Co., Limited, Fredericton, N. B.

Woodmen, construction camp workers, sawmill hands and others whose work takes them into wet places and rough going, need footwear out of the ordinary.

We have been over thirty years making special footwear for such kinds of work. This line we put on the market under the name of

USE THE SHIMER CUTTER HEADS

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc,

Made of steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.

The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

The Shimer Door and Sash Heads

Save the filing to shape at each sharpening of the cutters. They are made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge the fitting of the manufactured parts is assured.

A solid Door Head with Bits to work 1 to 1 1/4 inch Doors costs only \$18.03, and an Expansion Head only \$20.63. A solid Sash Head to mould 1 to 1 1/4 inch Sash, complete with Bits, costs only \$16.91—an Expansion Head fitted out complete only \$19.51. \$62.87 will give you an excellent solid section outfit, including Door Cope Heads and Sash Cope Heads. If you want the very best with Expansion the cost will be only \$68.07.

Double the Capacity of Your Matcher or Moulder By the use of the Shimer Double Ceiling and Double Flooring Heads.

Run your stock with double tongue and groove and then re-saw. 100 per cent gain in output for an investment of only \$40.94 and upwards.

The Bits on the Shimer Double Heads mark the saw cut line of division on the stock so that the sawyer can at once detect any variation of the saw and correct it as the board is passing through.

These Heads are not an experiment. We have made them for years and they are in daily use in the best mills of this and other countries. You will find them very complete and practical tools, carrying the Shimer guarantee to do as represented or no sale.

Heads for making Ship Lap

The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our matcher Heads and always produce good work.

Price, per set, complete, \$33.64 to \$38.48, according to thickness of cut.

Extra Bits for making Wainscoting on these Heads \$1.95 each.

Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete, \$17.87. Also made with 6 or 8 Bits to each Head.

Groove Head, Fig. 2. For plain matching or tongue and groove joint, complete with Bits, \$13.00.

Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits \$16.64.

Our Bedee Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 7

A Lumbermen's Club for Toronto

One of the most important events which has taken place for a long time in connection with the lumber industry in Toronto, was the formation, on March 13th, of a Toronto Lumbermen's Club. From the attendance at the meeting at which the organization was formed, and the enthusiasm of those present, it becomes a matter of wonder why a club of this nature was not formed at a much earlier date. The idea of such a club has been discussed from time to time by several members of the trade, and the meeting which resulted in its organization was really called for the sole purpose of discussing the matter, with a view to bringing it definitely before the trade and preparing the way for organizing it at a later date, if found advisable. That the members of the trade who were present should not only have favored the proposal, but have acted immediately upon it, is a most encouraging augury for the success of the club. No detailed explanation of such a club is necessary. Its principles are well understood as they have been put into practice in connection with many other industries and trades. Briefly speaking, a club will provide a place of social intercourse for members of the trade, where they can meet and have lunch, or where they can make engagements to meet one another for the discussion of business. It is possible, and even probable that the value of the club will be so clearly apparent from the first, that its activities will be increased so as to make it additionally useful to the trade in a number of other directions. With such a club in existence, affording a central place of meeting, results ought to be seen at an early date, in the way of an improvement in the general conditions surrounding business affairs. There is no reason for instance, why every member of the lumber trade in Toronto should not be on close terms of acquaintance with every other member. One would think that this would already be the case, yet the Canada Lumberman has frequently seen that it is not so, even in cases where firms, still unacquainted with one another, might have done much mutually

profitable business. An example of this was afforded at the very meeting at which the club was organized. A prominent wholesaler and a very large consumer of lumber came to the meeting and were introduced to one another, for the first time. The surprising thing was that they had not formerly become acquainted, although their offices are both in the same building. With a lumbermen's club in existence and every member of the trade taking an interest in it, such a thing would quickly become impossible.

Growing out of the better acquaintance with one another which such a club will develop, will come a better general trade relationship. It is not so very long ago since one heard far too many complaints from retailers in regard to the treatment they received from wholesalers and manufacturers, and at the same time one heard far too many complaints from wholesalers and manufacturers to the effect that retailers were too often in the habit of "kicking on principle" in the hope of securing price concessions to which they were not entitled. These complaints have not disappeared entirely, although fortunately, they are far fewer than they were a few years ago. The members of the trade have unquestionably come closer together in their relationships with one another of late years, and a great deal of good has resulted. There is, in fact, a fine feeling of business trust among the chief members of the trade in Toronto, but there is room for still further development along this line and the club will provide the most natural means towards this end. The fact that this improvement in trade relationship has occurred is directly responsible for the organization of the club. Members have come to know one another well enough to feel that they would like to sit down with one another at a meal, and to meet, not only in a business way, but in a business and social way combined.

The success of the club will depend largely upon the manner in which the members of the trade support it at the outset. It is a movement in their own interests which can be made just as useful as they desire to make it. The way in which those who were present at organization meeting, took hold of it, makes the chances strongly in favor of success. The details of the organization have yet to be worked out. Quarters have to be secured and members have to be enrolled. Two committees have been formed to attend to these matters. So far as quarters are concerned, it is likely that they will not present any difficulty. The membership question rests entirely with the lumbermen themselves. Their response to the request to join will give an early indication of the results to be expected. Prominent members of the trade are in charge of this matter and will call upon every member to enlist their assistance. Those who organized the club felt that there would be little difficulty in securing membership from practically every member of the trade in Toronto. It looks, therefore, as if the club will soon be an active factor in lumber trade life in Toronto, and it cannot then help being an important factor also in the lumber trade affairs of the whole province, as members of the trade from outside points will quickly become acquainted with the club and its doings. The question has already come up, in fact, how outside members shall be admitted. It is probable that they will be admitted at a reduced fee and that in this way the influence of the club will soon be felt in all parts of the country where lumbermen are interested in the Toronto market.

Reliable Information a Valuable Asset

Reliable information regarding customers and their requirements is the best foundation for business success. Upon it depends not only the extent of the business secured, but also its profitability. When one has at his finger ends information as to the exact class of material required by an important customer, and when that customer is found to be coming into the market with requirements for an important order, the chances are that this information regarding details will enable its possessor to secure the business. Everyone who is in the business of selling anything whatever, must pay attention to this elementary fact in order to succeed, yet it is strange how many opportunities for securing information of this nature are neglected even by the most up-to-date firms. There are some forms of business which depend entirely upon information of this nature and

which could not exist without it. A case in point is a general investment broker and promoter, who, when a young man, commenced to keep a scrapbook containing information about business opportunities of various kinds, devoting a good deal of attention to opportunities for investment in timber. This information was pasted away in index books and filed in cabinets. The result was that in the course of a few years it became a practical business directory containing information of the greatest value, thus enabling its owner to build up a unique and very successful business and to make himself and his services indispensable to a large number of wealthy clients.

Why should not this plan be adopted also in connection with the lumber selling business, both wholesale and retail? It is a simple matter involving merely the filing away and indexing of information which comes into one's possession in the course of daily transactions, and which, to many business men are in the habit of considering as valuable only in connection with the particular deal in regard to which it is secured. Such information, in many cases, is simply borne in mind for a time after the deal has been put through, and by the time it becomes valuable again, it has been lost. A scrapbook for such information, or a system of card files upon which it may be entered in abbreviated form is an easy matter to arrange and keep up. Its value is many times greater than the little trouble involved in its maintenance.

Apropos of such a plan, an instance illustrating it clearly is afforded by the case of a dealer who makes a specialty of lumber for mining purposes. Recently he received a requisition for timber from a large mining company, which, to the uninitiated contained such a mass of intricate details that it would be a very difficult matter to arrive at a safe estimate of the price of the material. But this particular dealer merely had to look up the information which he had on file and from it ascertained, at a glance, how much he could undertake to supply the material for. The result was a big order. The requisition was on a regular form and covered timber, lagging and wedges for 200 feet of main shaft. The information on file showed a

plan of a three compartment shaft, giving the net inside dimensions for each compartment, the depth of dado for end and cross sills, and notations giving the dimension and net length for each timber in the set. A list was also included giving the quantity and details of material required for 5 feet of main shaft. All this information had been secured in connection with previous orders, to obtain which, it had been necessary to expend a great deal of time, trouble and money in estimating upon individual items and running about to other dealers for material which was not in stock. Knowing thereafter just what this company required, and realizing that its business was worth being prepared for, the dealer with the information filed away is now able to quote on a requisition without a moment's delay. The order in question was for 200 feet of main shaft. The information showed how much was needed for five feet. The dealer merely had to multiply this by forty and send in his quotation. The whole transaction works like clock work and involves the least possible amount of expense. So successful was this plan that the dealer sent one of his best employees to visit all the other mining companies in the district for whom he could hope to furnish material, with instructions to secure similar information regarding them. He now has all this information filed away and the result, upon the volume of business secured, is surprising.

This plan, put into practice more generally would result in a revolution in many offices. It would do away with well-meaning but incompetent firms or individuals who rush after business, cut prices and bring about disaster to themselves and loss of business to others, simply because they are not furnished with the required facts that are essential to success. Greater competition would result if everyone followed the same plan, but it would be competition based upon knowledge. Even competition based upon knowledge of this sort, and carried on by individuals who may indulge in sharp practices, is preferable to the old-fashioned variety of competition based upon well-meaning ignorance. In other words a well-informed knave is a much safer competitor than an honest fool.

The Panama Canal and Lumber Prices

A great deal has been written of late about the effect which the Panama Canal will have upon the lumber trade of Canada and the United States. To the manufacturer upon the Pacific coast and the consumer in the east, this question is one of the greatest importance, and it will probably not be settled definitely until actual conditions have been worked out. The articles which have been published upon this subject, have, in many cases, taken either one side or the other of the question in a controversial manner. A very conservative estimate of the results of the opening of the canal, however, is contained in an article recently written by Mr. R. C. Bryant, professor of lumbering at Yale University, published in "American Forestry." In it, the writer expresses the opinion that the effect upon the lumber trade will be brought about slowly and that lumber from the Pacific coast will only take the place of the eastern and southern products, in measure as the supply of the latter dwindles; also that there will be no reduction in prices of lumber as a result of new competition, but a more gradual increase in prices than would have taken place without the influence of the canal. Professor Bryant's presentation of the case is, in part, as follows:

There are some who feel not only that the lower water rate which will prevail when the canal is open should permit Pacific coast operators to enter the eastern tidewater markets but who also foresee the possibility of delivering lumber, without rehandling, to canal boats at Albany, New York, at the terminus of the Erie Canal from which point it may be distributed to the large consuming districts tributary to it. This would not only open a large rural market in New York state but would permit them to invade the famous stronghold of eastern white pine, namely, the Tonawandas at the western end of the canal. By reloading at this point, lumber could be forwarded by an all-water route from Pacific coast points to the large lumber consuming centers on the Great Lakes, including Chicago, the largest lumber market in the United States.

That this dream of conquest will materialize in the next decade seems doubtful, although it may well come true when the supply of eastern woods is reduced.

The territory west of the Mississippi river is the fighting ground of the yellow pine and Douglas fir trade, with some competition in the north from white pine products. West of Denver the Pacific coast products have but little competition, but east to the Missouri river the competition grows more keen as the freight haul from the West increases. Beyond this point the territory is given over chiefly to southern yellow pine and to white pine.

Freight rates are the dominating factor in determining the territory in which a product can be sold profitably. As illustrating this, the rates for Douglas fir from Washington and on southern yellow pine from the South may be cited. The all-rail rate on fir products is 75 cents per 100 pounds from the Pacific coast to New York, which on flooring, per thousand board feet, amounts to approximately \$15, on dimension and common boards from \$18 to \$19.50, on timbers, not green about \$22.50, and on rough green lumber and timbers about \$24.75. The all-rail rate from points in Louisiana which ship yellow pine lumber to the same point as that mentioned for fir is 35 cents per 100 pounds, which is approximately \$7.75 per thousand board feet for longleaf pine flooring, \$9.50 on dimension and common boards, and \$15.75 on heavy timbers.

This gives the yellow pine manufacturers an advantage in freight rate alone of \$7.25 on flooring, from \$8.50 to \$10 on dimension and common boards, and \$9 on timbers. This handicap for fir timber is so great that only a very limited amount of the better grades can now be sent by the all-rail route.

Within the last year or two a very limited quantity of fir lumber has found its way into the eastern markets via the Isthmus of Panama, due to a combination rail and water rate from 40 to 50 cents per

100 pounds from Puget Sound points to New York. This rate was inaugurated by a steamship company operating on the Pacific coast. Lumber has been reshipped from the Atlantic seaboard as far west as Buffalo at a cost of \$125 per car less than it could have been sent by an all-rail route. The amount of lumber sent by the water route has been small because of the limited facilities available, so that this means of transport, has had no effect on transcontinental rail rates.

The question of what water rates will apply from the West Coast to the eastern seaboard, via the Panama canal, is yet undecided, but it has been estimated that American ships will charge from \$11 to \$12 per thousand board feet for this service. It is doubtful if the amount of lumber traffic through the canal from west to east will assume large proportions, at least for some time after the opening of the canal, because of the lack of suitable American bottoms in which to carry the product. While there are some new lumber carriers now under construction for the canal trade, the total carrying capacity will not be such as to make a very strong impression on eastern markets.

Another important factor is the lack of adequate lumber handling facilities at many of the Atlantic coast ports. A large part of the water shipments which now come both from Canada and from the yellow pine region of the South are in comparatively small cargoes made up of parcel lots which are delivered at various docks. The

lumber is also often in mixed lots destined for interior rail trade. Large vessels carrying cargoes of from four to six million feet, will find few ports where there are sufficiently large receiving yards to permit of the rapid unloading of the vessel, and there will be little encouragement for the owners of lumber carriers of large capacity to engage in lumber transport until this condition is remedied.

It is not to be expected that the opening of the Panama canal will either be a panacea for all of the troubles of the Coast lumbermen or the means of giving the people of the eastern part of the United States cheaper lumber, since it will take some years to build up a trade in western lumber and to develop shipping and terminal facilities so that the movement of large quantities of fir lumber will be possible. In the meantime the advancing price of stumpage and the reduction in the annual output of southern yellow pine, its greatest competitor, will have reduced competition and the territory now controlled by the pine manufacturers will gradually be absorbed by the Coast manufacturers without any marked reduction in lumber prices—probably at an increased price. We need not expect cheaper lumber on the eastern seaboard because of the opening of the canal but we may reasonably hope to have a more gradual increase in lumber values than we would be warranted in expecting if the products of the great forests of the west were not to be made available to us at a transportation cost much lower than now prevails.

Editorial Short Lengths for Busy Readers

The Board of United States general appraisers has sustained the protest of F. W. Myers and Company, of Burlington, Vt., holding that certain lumber, known as novelty siding, imported from Canada, is entitled to free entry under paragraph 647 of the Tariff Act. This is one of the first decisions in classification cases under the Underwood-Simmons law, to be handed down by the Board. The lumber in question was assessed for duty at 15 per cent. ad valorem under paragraph 176, providing for house or cabinet furniture, and manufactures of wood. The general appraiser, who wrote the decision, reversing the collector's assessment, said: "It is difficult to conjecture upon what theory the collector classified this lumber under paragraph 176."

According to opinions expressed by a number of British Columbia Shingle manufacturers, the removal of the duty upon Canadian shingles entering the United States has resulted in great increases in the exports of shingles to that country. It is reported that most of the shingle mills in British Columbia are shipping almost their entire output to the United States. One prominent shingle manufacturer states that 95 per cent. of the shingles now manufactured in British Columbia are crossing the border, and that the demand for these shingles in the United States has been gradually increased since the duty was removed. 80 per cent. of the shingle mills in British Columbia are now operating, according to this report, and the output is given preference in a great many parts of the United States. Under these conditions it is expected that the shingle trade during the coming summer will be very active. The invasion of British Columbia shingles has not been received with any pleasure by shingle manufacturers in the State of Washington. One British Columbia manufacturer claims that circular letters have been widely circulated in the United States criticizing the Canadian product and claiming that it is not properly manufactured or packed. It is questionable whether the reports above mentioned are entirely accurate. Many manufacturers scarcely believe that as much as 95 per cent. of the output is going south. There is no question however, that the United States markets are taking largely increased supplies of British Columbia shingles.

Every now and then one hears discussion in regard to the necessity, or the importance, of considering both sides of a board in connection with grading. This is a matter which becomes of much interest when one considers the consumption of lumber in the manufacture of furniture case-work, interior finish, table tops, and many other commodities on which only one side is exposed. So far as the consumer is concerned it makes no difference what the worse side of

the board looks like, so long as the material which is to be exposed is clear. Therefore, there is no reason why such a consumer should pay for lumber that is clear on both sides. Hardwood Record, in a recent article upon this subject says that many lumbermen are now taking advantage of the ability of consumers to use lumber with reference to one side only, and have been specializing in the sale of "one-face 1sts and 2nds." The description of lumber in this manner, it says, is different from the term "select," even where a definite select grade is provided, for in the rules. The select board is good on one side, of course, but the usual provision is that the worse side shall not be below a No. 1 common. In the special grade, known as "one-face 1sts and 2nds," the other side may be anything whatever, as nobody cares how many defects it carries. Certainly, this plan is a good one for the consumer, who gets what is to all intents and purposes good lumber for less than 1sts and 2nds prices, and for the lumberman, who can select his common stock so as to make good lumber out of it, as far as one-face only is concerned. Moreover, this selection means service to the consumer, for which he should certainly be willing to pay.

An observer with excellent opportunities for observation and a knowledge of the conditions in a recent letter from the Pacific Northwest to a U. S. lumber trade journal writes: "I am not seriously concerned about competition from British Columbia. In the first place, stumpage values are, as a rule, higher in the Province than in the States; the carrying cost is practically the same, and the cost of manufacturing is greater. We cannot hope to compete with British Columbia in the shingle business, because British Columbia manufacturers who have behind them such a vast quantity of cedar are willing to convert their best logs into shingles, whereas on this side of the line we make our best logs into boards and convert the waste into shingles. As a result, the Province turns out better shingles than we do. The reputation of the product is already established throughout the States and particularly in the New England market. On the other hand the Province has a very heavy percentage of so-called inferior species and low grade timber to be disposed of in the face of our competition with better timber. The balance of the trade in lumber as between Canada and the United States is greatly in our favor. In fact the British Columbia lumbermen are constantly complaining against the large shipments made into the Prairie Provinces by us. The Government of the Province is busy right now in seeing to it that a large percentage of the increment shall flow into its treasury. We need have no fear of serious competition except as it shall be made possible through the operations of our absurd shipping laws in their relations to the trade we will some day have along the Atlantic seaboard."

Toronto Lumbermen Organize Club

Hold Meeting and Appoint Committees to Work Out Preliminary Details—Directors and Officers Chosen

A meeting of lumbermen of the city of Toronto was held at the Queens Hotel on Friday afternoon, March 13th, for the purpose of discussing the advisability of forming a Toronto Lumbermen's Club. There was a good attendance and all present were heartily in favor of such a step. An informal discussion took place for some time, during which several of those present described the clubs which already exist in a number of United States cities, such as St. Louis, Cleveland, Chicago, Detroit, etc. Practically all these clubs are run upon similar principles. They provide a suitable place of meeting for lumbermen, where it is possible to take visiting members of the trade and also where luncheon is served daily. These clubs are enthusiastically supported by the trade and, every day, a lumberman can depend upon meeting at the club a number of other members of the trade. This makes the club exceptionally valuable from a business point of view and also introduces a social feature which goes a long way towards developing among the members of the trade a commendable spirit of good fellowship. Some of the clubs also make a feature of having periodical meetings of a general nature at which the members partake of a luncheon, or evening meal and are then entertained either by a smoking concert or an address by some prominent business or public man.

Many members of the trade in Toronto have been considering for some time the advisability of forming such a club, for the Toronto trade. The result of the meeting was, that after a very interesting discussion, a motion was presented by Mr. W. J. MacBeth and seconded by Mr. J. G. Cane, to the effect that the meeting be considered the first meeting of the Lumbermen's Club of the city of Toronto and that a membership list of those present be drawn up. This motion was carried unanimously, after which a motion was introduced by Mr. W. J. Lovering, seconded by Mr. L. F. Strickland, that Mr. G. Wilf Boake be appointed treasurer of the club. This motion was also carried. A third motion was carried that Mr. H. Boulton (Canada Lumberman) be secretary of the club.

On motion of Mr. J. G. Cane, a list of those present was drawn up, each member signing his name to an agreement to become a member of the Toronto Lumbermen's Club and to pay a provisional membership fee, which, on motion of Mr. W. J. MacBeth, seconded by Mr. L. F. Strickland, was placed at \$10.

In order to proceed immediately with the carrying out of the preliminary details connected with the formation of the club, two committees were formed, one to act as provisional directors, consisting of Messrs. J. G. Cane, W. J. MacBeth, R. A. Rastall, G. Wilf Boake, H. Boulton and A. E. Eckardt. The second committee, consisting of Messrs. Jas. Lauder, J. G. Cane and W. J. MacBeth, will look into the matter of securing quarters for the club. In this connection, the opinion of those present was in favor of securing a suitable room or rooms in connection with some hotel or restaurant, where meals may be secured, preferably upon the American plan. It was at first suggested by Mr. W. J. Lovering that the club should confine itself for a time to the holding of weekly luncheons, with a view to getting all the members of the trade thoroughly interested, before expanding into a regular club with fixed quarters for daily use. This idea was discussed at some length, but those present thought that the best way to place a club immediately upon a working basis would be to secure fixed quarters where luncheon could be served and where members could meet one another daily. At the same time, it was decided that a few members of the club should call upon lumbermen in the city immediately and sign them up as members. This idea proved acceptable to all present and it was agreed that Mr. W. J. Lovering, Mr. G. Wilf Boake and possibly one or two others should take this work in hand.

After further informal discussion which indicated strongly that the members of the trade in Toronto would support a club of this nature with enthusiasm, and would find it extremely valuable to them in many ways, the meeting was adjourned. A further meeting will be held in the near future, as soon as the committee upon securing quarters and the committee upon securing members are ready to make their report.

Those who were present at the meeting were W. J. Lovering; J. R. Chelew, Chelew Lumber Company; A. E. Eckardt, R. Laidlaw Lumber Company; R. B. Elgie, Elgie & Jarvis; J. A. Detweiler, Quincy Adams Lumber Company; Ross A. Rastall; Jas. Lauder; W. J. MacBeth; Thos. Gray; Geo. H. Hager, S. A. Hager & Son; L. F. Strickland, Canada Lumber Company; Harold W. Thompson and H. Boulton, Canada Lumberman; J. M. Donovan, Long Lumber Company and G. Wilf Boake. In addition to these, letters and messages indicating approval of the proposal to form a club were received from many of the Toronto trade, who, on account of their business engagements, were unable to attend. Among these were Robert Vestal,

Atlantic Lumber Company; W. J. Hetherington, Wm. Laking Lumber Company; H. J. Terry, Muir, Terry & Gordon; D. McLaren, H. G. McDermid and C. W. Wilkinson, Union Lumber Company; A. C. Manbert, Graves, Bigwood & Company; and Hugh A. Rose, Canadian Western Lumber Company.

The Workmen's Compensation Act

The Workmen's Compensation Act introduced into the Legislature of Ontario, received its first reading on March 17th, a second reading a little later and was then submitted to committee. The indications at the time of this writing were that the bill would be put through by the government with very little additional change and become the law of the province. The whole situation is a most unfortunate one, leading to the feeling, on the part of manufacturers and employers, that their interests have been betrayed and that they are entitled to very different treatment from that which they have received. They believe that the bill, for reasons which have already been outlined in these columns, is nothing short of grotesque. If passed in its present form, it means that the administrative board to be appointed under the Act will have almost unlimited powers to draw up a measure for themselves, which will be practically a new one. From the manufacturers' point of view the whole bill is an impossible one. Certain lines of action must be definitely prescribed for the board. For the successful working out of so important a measure, the bill should be very minutely settled in practically all its details, from the outset. A single illustration of the bill's impracticability is afforded by the proposed method of assessment. The board is empowered, at the end of the year to assess for the accidents which have occurred during the past year. How will it be possible under such a system to secure the contributions of such firms as may have come into existence and gone out of existence during that year, whose contributions nevertheless, to the general fund, would be of great importance? The only practical method would be based upon an assessment upon the estimate pay roll at the beginning of each year. This is just one of many instances that could be cited in criticism of the bill as it stands. Manufacturers and employers throughout the province are so much concerned in regard to the situation which is likely to be forced upon them, that a movement is at present on foot for holding a large convention to protest against the measure in its present form.

Forest Product Laboratories Being Increased

Not quite six months ago, the Federal Government established the Forest Products Laboratories at McGill University, with view to conducting scientific investigations which will assist the movement for forest conservation, particularly in the matter of preventing waste and utilizing products which are now allowed to decay or are destroyed owing to lack of knowledge of how they can be profitably utilized. The work is divided into seven branches, each having a distinct bearing on the economical utilization of lumber. The laboratories are a branch of the Forest Branch of the Department of the Interior. It is now proposed to increase the work, and application has been made to the University for use of the Nelson building on University Street, Montreal, and this will be granted, provided repairs can be carried out. Later, the laboratories will be housed in one of the new buildings which are to be erected. At present the department is located in part of the old medical building and the experiments are carried out in the laboratories in the engineering building. It is proposed to increase the staff during the present year, and when the departments of wood preservation and wood distillation are added, the staff will have to be still further augmented. The department is in charge of Mr. A. G. McIntyre, but on his leaving to take up the duties of manager of the Bathurst Pulp and Paper Company, to which he has just been appointed, he will be succeeded by Mr. John S. Bates, B.A.Sc.

Move Toronto Offices

The Atlantic Lumber Company has removed its Toronto offices of which Mr. Robert Vestal is manager, from 211 Kent Building to 110 Manning Chambers. The Atlantic Lumber Company are manufacturers and wholesale dealers in southern hardwood lumber, with head office at Boston, Mass., and mills at Knoxville and Walland, Tenn., and Franklin, Va.

Log production in February totalled 26,410,998 feet in the coast district of British Columbia. This is approximately 5,000,000 feet more than in January, and is still very low.

The Great Western Railway Company of England has recently placed a contract with Herbert Morris, Limited, for the supply of all the Chain-Blocks which may be required during the year 1914. This is the thirteenth successive year in which the Great Western Railway Company has decided to purchase Morris Chain-Blocks.

E. I. Harrington now with Boake Mfg. Co.

Mr. E. I. Harrington.

About a year ago Mr. E. I. Harrington, whose portrait is published herewith, being imbued with an ambition to find a larger field for work than the one in which he had been engaged in the United States, came to Canada and accepted a position as sales manager for the Canada Lumber Company of Toronto. After a year of very successful work in this position, Mr. Harrington is making another change and taking a position with the Boake Manufacturing Company of Toronto as manager of their sash and door department. Mr. Harrington comes from Columbus, Ohio, where he attended the Ohio State University. He received his early business training with the Cole Manufacturing Company of Memphis, Tenn. Returning later to Columbus, he was

appointed general buyer of the sash and door department of the Cussins and Fearn Company, a position which he occupied with much success until his removal to Canada.

Mr. Harrington is a sash and door specialist, and an authority in his line. During his year in Canada, he has become forcibly convinced of the great prosperity which is in store for this country, with its great extent of territory, unlimited resources and independent and progressive people. Mr. Harrington, in short, has become an enthusiast on Canada and can see nothing but prosperity ahead for this country.

Mr. Harrington succeeds Mr. Kenny S. White who has worked up an excellent trade for the Boake Manufacturing Company in sash and doors during the past five years and whose retirement from the retail end to take an important position with the Payne Lumber Company of Oshkosh, Wis., will be regretted greatly by many buyers of doors and sash. Mr. Harrington, however, will do his utmost to fill this gap successfully.

Kenny S. White to Represent Paine Doors

Mr. Kenny S. White who has been in charge of the sash and door department of the Boake Manufacturing Company, Toronto, for the past five years, has accepted a position with the Paine Lumber Company, Oshkosh, Wis., and from April 1st will represent them on the road throughout Canada. His headquarters will be at Oshkosh. The Paine Lumber Company, as most lumbermen know, specialize in veneered hardwood doors. Mr. White has not only had valuable experience in connection with the sash and door business with the Boake Manufacturing Company; but also was, at one time, a very successful traveller for the Gilmour Door Company of Trenton, Ont., so that the Paine Lumber Company are securing, as their Canadian traveller a man who knows the trade thoroughly and who is a specialist in their line.

British Columbia's Royalty Bill Widely Approved

Many compliments have been received by the Hon. William R. Ross, Minister of Lands, for British Columbia, in regard to the Timber Royalty Bill recently passed, in which the principle of profit-sharing in the timber resources was a feature. Prominent Canadians and residents of the United States, including members of the Cabinet of that country, have sent letters warmly commending the new Act.

Henry S. Graves, Chief Forester of the United States, writes: "I have just learned of the recent action by British Columbia with reference to the royalty on public timber. I want to express my pleasure at the great progress which has been made in your country and to extend my heartiest congratulations. The recognition of the right of the public to share in the increasing value of public timber is, in my opinion, a vital one."

The Secretary of the Department of Agriculture of the United States writes: "The plan of readjusting stumpage values of timber at stated intervals in sales from public lands whereby the public will derive a fair share of the increase in lumber values is one with which I am in hearty accord. You will doubtless be interested in learning that a provision of this character is included by this Department in all contracts for sales of timber from National Forest lands where the period of contract is in excess of five years, and that it has been accepted as equitable by timber operators. I feel that you are to be heartily congratulated on this progressive legislation."

Hon. Clifford Sifton, President of the Canadian Commission of Conservation, writes congratulating the Minister of Lands and says: "I have repeatedly said during the last year that British Columbia was the most advanced province in the Dominion so far as attention to the question of forest protection was concerned, and I may now say the same thing in regard to the question of disposition of timber belonging to the province."

St. Lawrence Company Has Large Plans

The St. Lawrence Pulp & Lumber Company of Canada, whose incorporation, financed and controlled by William Whitmer & Sons, Inc., lumbermen, and Chandler & Company, Inc., and W. F. Fuqua & Company, bankers, all of Philadelphia, was recently reported in these columns, is one of the most extensive propositions of its kind ever started in Eastern Canada. The company obtained under Crown grant a tract of some 640 square miles of spruce, balsam and cedar and pulp-wood, located in the counties of Gaspé and Bonaventure, Province of Quebec. Its mills will be located on Chaleur Bay (an arm of the Gulf of St. Lawrence) at the mouth of the Grand Pabos River, which of itself forms a spacious bay. Prior to the present ownership of the property, the interests affiliated with its organization had the tract cruised by Messrs. Lemieux Bros. & Company, New Orleans, La., expert timber estimators, who reported the tract superior to any they have ever estimated in the Province of Quebec, Nova Scotia or New Brunswick. The timber along some of the streams has never been touched.

The timber, they state, consists of spruce, balsam, cedar, white and yellow birch, and scattered white pine. Disregarding the pine and birch they estimate the quantities of timber on the tract, log scale, Quebec rule, as follows:

Balsam	1,212,000,000 feet
Spruce	969,600,000 feet
Cedar	121,200,000 feet

Total merchantable timber	2,302,800,000 feet
Pulp-wood	4,040,000 cords

These totals the estimators consider very conservative, especially the pulp-wood, which they have stated to be 10 cords an acre. Practically there is an almost unlimited supply of pulp-wood on this land, enough to turn out easily 60,000 to 100,000 cords a year. The property, they say, could easily support three saw mills of a capacity of 100,000 feet a day each.

The transportation facilities are specially good, as the tract is traversed by four main rivers, the Grand Pabos, the Little Pabos, the West River and Port Daniel River. The timber is all easily accessible by water and the topography is such that logging by railroad is also very convenient.

As to shipping, the property is accorded the double facilities of railroad and ocean transportation. It is four days distant by water and two or three days by rail from New York and nearer in point of time to that city than the timber fields of West Virginia.

The company will have a saw mill of 150,000 feet daily capacity; a sulphite pulp-mill of 100 tons a day, and a standard gauge railroad, connecting with the Atlantic, Quebec & Western railroad. About 9½ miles of the railroad, including terminal trackage have been completed, and it is now in operation into the timber limits, reaching Camp No. 1. The mills and town site are located on the northeast shore of the Grand Pabos bay and are ideally situated from an operating standpoint. The saw and pulp mills face each other on the sides of two adjoining hills. An arm of the bay runs between them and is being dredged to form a hot pond, into which the logs will be dumped, and drawn out by the two mills as required. The present equipment now on the ground consists of one 70-ton Shay locomotive, an American Locomotive Company direct drive line engine, five steel flat cars for logs, an American log loader, with steam shovel attachment, tug boat, barges, etc. Thirty additional steel log cars have been ordered.

Will Permit Export of Pulpwood Temporarily

A bill has been introduced in the Ontario Legislature by Hon. W. H. Hearst, Minister of Lands, Forests and Mines, to permit the export of pulpwood, temporarily, during the present year. So much timber was blown down in Ontario by the severe gales last fall, that it has become of great importance to have it moved quickly, so as to avoid loss and danger from fire. For this reason the government has decided to remove "the manufacturing condition" in connection with pulpwood logs. A bill has also been introduced by Hon. Mr. Hearst to amend the forest fires prevention act, to enable the Minister of Lands, Forests and Mines, upon application from any municipal council, to order the owner of land within the limits of the municipality or adjacent thereto which is a source of danger from fire on account of unfinished clearing, to clean up the land properly within a fixed time. In case the owner fails to do so, the bill provides that the Minister may have the work done and the cost charged to the owner.

Valuable Report upon the Trent Valley

Government Management Could Still Make it an Extensive Producing Area—Interesting Comparison of Cut To-day With Thirty Years Ago.

A valuable report upon the Trent Valley Watershed in Ontario, prepared by C. D. Howe & J. H. White of the Faculty of Forestry of the University of Toronto, on behalf of the Canadian Commission of Conservation has been published by the Commission. The report also contains an introductory discussion by Dr. B. E. Fernow, Dean of the Faculty of Forestry, of the University of Toronto. The report is elaborate and unusually complete, when one considers that it is the result of a field survey carried on during the course of one summer. It presents the problem of the Trent Valley in clear and very definite form, and outlines a method of solution which, if carried out, will result in incalculable benefit to that part of the province of Ontario.

Dr. Fernow, in his introduction, after dealing with the Trent Valley problem in general, discusses the causes of deterioration which have led up to the present situation. At the present time, he says, the pine timber, at least, is practically gone from this watershed. A forest cover still exists, but, with the present commercial value almost entirely extracted, interest in its condition is gone; fires have swept through it repeatedly, each time causing further deterioration of the forest cover, until, finally, the bare rock condition or man-made desert is the result. At present, only beginnings of these conditions can be seen here and there, yet in the three townships of Methuen, Anstruther and Burleigh alone, nearly 150,000 acres of such desert exist. And, if the present policy of indifference and neglect continues, what might have been a continuous source of wealth will become, not only a useless waste, but, through the changes which the water conditions will undergo, may also prove a menace to industries which have been developed to utilize the water-powers of this watershed.

Here is an area similar to thousands of square miles in other parts of the eastern provinces, and the conditions in this watershed are by no means extraordinary. They repeat themselves wherever axe and fire have been permitted to destroy the original growth in the Archaean rock country, that is to say, wherever lumbering under the license system has been permitted, without safeguarding the property as a producer. The sequence of this mismanagement is everywhere the same. The removal either of the best or of all timber, without disposing of the debris, leaves a slash which is invariably subject to fire; after this, a loss of interest takes place on the part of the licensee and, what is still worse, on the part of the government. Nature then attempts to reproduce the forest and this is followed by a repetition of the fires, which kill the seed trees and seedlings of the better kinds. The ground is then re-covered by aspen and birch for a time; but, through repeated conflagrations, it is finally rendered useless for any productive purpose.

Recommendations

Discussing the methods to be adopted for improving the situation, Dr. Fernow says: Nobody who has studied the conditions presented in this report will hesitate a moment in agreeing that the bulk of the country involved should be placed in, and managed as, a permanent forest reserve for the growing of timber. The only question can be: How this is to be brought about? There are at least five interests to be considered or reckoned with and to be brought into co-operation in building up such a territory—the Dominion Government, the Provincial Government, the municipalities in which the territory is situated, the private owners of properties and of timber licences, and the public at large.

Besides the general interest which the governments naturally have in the economical condition and development of any portion of the commonwealth, the Dominion Government has a special interest in maintaining the canal. The Provincial Government still controls about one-third of the area, partly under timber licenses, partly in cancelled or abandoned lots. The municipalities are naturally most closely interested in seeing as much of their land as possible put to profitable use, in order to reduce the individual tax assessments and, at the same time, to permit of a higher degree of civilization through increased industrial activities and educational facilities.

Private landholders will be benefited by better protection. Their property will increase in value owing to the improved environment, particularly if a continuous improvement of conditions is assured in place of the present tendency towards deterioration. With management for perpetuity, instead of exploitation for a short time, permanent manufactures can be established, industrial development will increase, and the public at large will gain in prosperity.

Co-operation of all these agencies will be necessary to carry through any far-sighted, persistent policy. The co-operation of the three administrative agencies, the Dominion, Provincial and Municipal governments, is especially needed to develop anything like a

permanent forest policy, for forest growth is slow, and financial results from timber growing, the only incentive for private enterprise, are slow in coming, so that only persistent entities like governments can be expected to carry on the business of timber growing. The policy, then, should be to bring all the lands which are not strictly farm lands as rapidly as possible under the control of one, or any, of these three agencies. These lands should be combined into one or more forest reserves, and a forest administration should be provided for.

For the management of these properties with a view to obtaining a substantial yield, Dr. Fernow says that the co-operation of a financially strong government, with its superior credit and organization, is needed. If, as appears probable from the appointment of a provincial forester, the provincial government assumes its responsibility for the future of the timber resources of the province, this region offers a most promising first field for action. A plan should be drawn up for recovering licensed lands and for dividing them into units to facilitate management, some to be managed by the province and some by the municipalities. The plan should allow for the provision of technical advice for their management, and for the furnishing of such financial assistance as may be necessary through a municipal and state bonding scheme. The rights of supervision and participation in eventual returns should be retained by the province. Some such plan of co-operation should obviously be elaborated; the province selecting for transfer to the municipality such tracts as entail merely protection, and undertaking the management of the more complicated tracts as its own reserves.

The first step for the province to take would appear to be to repossess itself of the licensed lands which have practically ceased to produce the quantity of logs contemplated under the original licenses. The next thing would be to impose upon the timber limit holders, who have still some valuable timber left, such conditions as would prevent the jeopardizing and the destruction of the property itself.

If the province assumes the responsibility of such a conservative forest policy, the Dominion might well be relieved of participation in it, for its interests would then be subserved. If, however, it is not the intention of the province to protect, recuperate, and manage these forest areas efficiently, the Dominion should, by control of the watersheds, be placed in a position to protect its water rights.

An efficient forest management, especially of cut-over lands, can be satisfactorily carried on only if compact properties of sufficient size are placed under one management. It is a great advantage that such conditions are found here, namely, compact areas of land in the hands of the Province, which could be placed in one reserve under one manager. The man in charge of such property must be a real and circumspect manager, continuously active on the ground. His first duty would be to make a careful survey and map of the property, showing conditions in detail, at the same time, organizing an effective service for protection against fire, building watch-towers, and, where roads or ready means of travel do not exist, he should provide trails, gradually perfecting the protective service. Next, he must make it his business to encourage the establishment of small woodworking manufactures that can utilize the mature hardwood timber, as well as the minor forest products now going to waste. The small values that can be secured by an efficient local manager so far as possible, must be made to pay the cost of recuperation. He must also encourage private enterprise to develop the tourist travel and foster the fish and game resources as a not unimportant asset of the forest reserve. Then follows the improvement of existing stands and of natural regeneration by thinnings, the proceeds of which should, together with the profits of such logging of mature timber as may still be done, pay for the operation.

As to financial outcome we can quite reasonably figure that a 500,000 acre reserve, half the present forest area, managed in the manner indicated, even in the poor condition in which it is found, could almost from the beginning pay for its maintenance by the sale of odds and ends of available timber at the rate of 5 cents per acre, or \$25,000 per year. Within a decade, when the first 750,000 cords of poplar pulpwood become available this would yield, if cut off in 25 years, at least \$100,000 per year, or 20 cents net revenue per acre, from this source alone. By the time this is exhausted and replaced by a young pine stand, further pulpwood areas and some pine would have become ready for the axe, wood values would have increased, and an annual income of not less than \$2 per acre from a sustained wood yield may be assured forever. This would be less than one-third of the net revenue derived from a forest property of approximately the

same size in Germany, the State Forest of Wurttemberg—not an unreasonable expectation!

The natural reproduction on the areas that are kept free from fires is found unusually favorable; it would therefore not be too sanguine to expect eventually an annual increment of 100,000 M. feet of saw timber besides other materials; that means an annual business in growing, harvesting, transporting, and manufacturing, of not less than \$5,000,000 to \$6,000,000.

Lumbering Conditions

An interesting section of the report deals with lumbering conditions which existed in the Trent Valley in earlier days, comparing them with those of the present day. In former times, the report states, the region under consideration lay within the southern fringe of the vast pinery that covered the southern slope of the Laurentian shield. In nearly all the townships, licenses had been issued in the early "sixties," and by the "seventies" the lumbering industry was one of the first magnitude. During the season of 1872-73, the cut of pine from this watershed amounted to some 120,000,000 feet; last season probably less than 10,000,000 feet of pine were cut. The same season saw the close of operations by the largest pine lumbering concern of the region; probably but four concerns remain able to scrape together a million feet of pine yearly. Five years will see the end of the pine so far as commercial quantities are concerned. With the exhaustion of the remaining softwood stands, mainly hemlock, in certain portions of Stanhope, Sherborne, Galway, Cavendish, and Anstruther, the lumbering of coniferous species will be practically at an end, and this will be within a decade. The present limit holders realize this and are buying all they can from settlers. One mill was found whose sole supply of logs came from discarded logs of former operations and pine "rampikes" dead many years.

At present there are ten lumbering concerns whose operations within the watershed exceed one million feet of logs a year each. The total cut in 1911-12 was in the neighborhood of 40 to 45 million feet, distributed approximately as follows: pine 40 per cent., hemlock 20 per cent., with small amounts of spruce, basswood, ash, elm, cedar, birch, balsam, maple, tamarack and beech. Probably 10,000,000 feet of this came from the semi-virgin townships in the north owned in fee simple, with which we are not here concerned. As already intimated, the 1912-13 cut will show much less pine. The bulk of the logs are sawed at Marmora, Peterborough, Lakefield, Lindsay, and Cobocok.

Besides the saw-log industry there is a small production of cedar poles, posts and cross ties, shipped principally from Coehill, Kinmount and Haliburton. But the opinions of those engaged in the business confirm the field observations that the cedar swamps are nearly exhausted. Cedar is a species of such slow growth that its extinction, commercially, is unavoidable.

A small amount, probably not over 3,000 cords, of spruce, balsam and poplar, cut by settlers, is shipped out of the region, mostly from Kinmount and Gooderham, for manufacture into pulp and paper. Some of this goes to Campbellford, Thorold, etc., but the bulk of it goes to Pennsylvania despite the long transportation. This is probably owing to the fact that the majority of the Ontario mills possess their own limits. During the past season the average prices paid the settlers were \$4 per cord for poplar, and \$5.50 for spruce and balsam.

In addition to the pulpwood, there is a small trade in basswood and poplar for excelsior, and cordwood for fuel, to various Ontario towns and cities, as well as a small quantity of tanbark, which is shipped to factories at Acton, Toronto and Omeme. An example of close utilization is seen in the shipment of fire-killed pine, with cull pine and hemlock, to Toronto brickyards, from certain points along the Haliburton branch of the Grand Trunk Railway. There are also a few small cooperage plants at Marmora, Deer Lake, Glanmire and Kinmount, but elm, the species most largely used, is getting scarce.

In the wake of the lumbering operations, fire has followed, so that to-day over one-half (57.3 per cent.) of the forested area is composed of poplar stands, the majority of them 15 to 30 years old. These, with the hardwood areas, which as yet have been but little exploited, constitute the future source of wood supply in this region. The hardwoods cover one-third of the total forested area.

The future of the lumbering of the region lies mainly in the utilization of the poplar and maple. Some of the lumbermen, when discussing the possibilities of future industrial development, claimed that the maple, owing to seam and black heart, is unprofitable. But it must be borne in mind that the handling of hardwood is a proposition of so different a nature from pine lumbering that success cannot be expected where it is treated as a minor adjunct to a softwood business. Hardwoods as a whole are more defective, and the closest utilization of every log, not of maple only but of all the species, for the particular product for which it is best suited, is necessary to secure proper returns in the hardwood business. The field for the development of local minor wood-using industries, especially the

manufacture of small woodenware, has not, as yet, been developed, although waterpower is available everywhere.

The other species, poplar, now covering some 560,000 acres as a result of past fires, will, in the course of 15 to 20 years be mature, and ready for manufacture into pulp, matchwood, etc. It represents a forest resource of great value, not only owing to the great quantity in almost pure stands, but also on account of the favourable conditions of transportation and water-power manufacture.

Despite the deterioration during the last forty years in the character of the forested area of the Trent watershed this region still possesses much forest wealth—one worthy of conservation by progressive methods of treatment.

An appendix to the report contains the following interesting tabular comparison of the present cut of pine and that of thirty-one years ago.

Cut of Pine, Season 1872-73

Operators	Mill	Cut Ft. B.M.
Gilmour & Company.....	Trenton	22,000,000
Fowlds Bros.....	Hastings	1,500,000
McDougall & Ludgate	Harwood	10,000,000
Uilyott, Sadler & Company	Harwood	12,000,000
Dickson Company	Peterborough	5,000,000
Geo. Hilliard	Peterborough	4,000,000
John McDonald	Peterborough	1,500,000
Jas. Z. Rogers	Ashburnham	1,000,000
Boyd, Smith & Company	Nassau	6,000,000
R. S. Strickland & Company	Lakefield	4,000,000
N. Shaw	Buckhorn	2,000,000
W. A. Scott	Mississagua River	5,000,000
Mossom Boyd	Bobcaygeon	10,000,000
J. D. Smith & Company	Fenelon Falls	9,000,000
Hilliard & Mowry	Fenelon Falls	4,000,000
Green & Ellis	Fenelon Falls	5,000,000
W. M. Snyder	Sawn by contract	3,000,000
A. H. Campbell & Company	4,000,000
Paxton, Bigelow & Trounce	Port Perry	5,000,000
		117,000,000

In addition to the foregoing, there is the unenumerated cut of small operators and the cut of square timber for the Quebec market, figures for which are not available.

Long Lumber Company Celebrates Tenth Anniversary

On Tuesday, March 17th, Mr. Guy H. Long, of the Long Lumber Company, Hamilton, Ont., celebrated the 10th anniversary of the foundation of the company by entertaining its employees at a very successful banquet which was held at the Commerican Club. It was just ten years on St. Patrick's day that the first bill of \$5 for office rent and use of typewriter for 2 weeks was paid by the Long Lumber Company. From that date until the present, the company had made wonderful strides, and is now one of the most successful and extensive lumber selling companies in Ontario.

At the banquet there were present about forty guests, the following being a list:—Guy H. Long, H. N. Kitson, J. S. Hossack, J. W. Stairs, Jos. Thwaites, W. R. Bennett, Jas. McNaught, Jas. Bethune, Tom Allen Jr., Jas. Bryers, A. Stewart, R. Press, F. Depew, John Poag, Bert McKay, Chas. Kilgour, Guy Montrose, J. J. Evel, Mr. Elliot, A. Tory, Alex. Milne, H. W. Thompson, Toronto, T. J. Rousell, C. A. Hunter, Roy Stewart, J. M. Donovan, Geo. Wisner, H. P. Brierley, D. G. Webster, F. R. Burton, Roy Anderson, Frank H. Harris, Toronto, Theodore Christman, Oliver Burke, W. E. Galloway, Bob Hysert, R. G. Wilson, E. M. Faulknor, Fred Williams and Frank Maw.

Mr. H. N. Kitson presided and acted as toast-master. The after dinner speaking consisted of proposals and replies to toasts to the King, to Mr. Long and to the guests. Several excellent speeches were delivered in connection with these toasts. An interesting musical programme was also carried out and when the speaking and music had been concluded the guests were entertained by various social games.

One of the most interesting events of the day was a presentation by the staff, to Mr. Guy H. Long, of an exceedingly handsome gold wrist watch, suitably engraved, which was greatly appreciated by Mr. Long.

Douglas Fir Timber For Toronto Harbor

Order for 24,000,000 Feet Secured by Empire Lumber Company—Contract Involves Over \$250,000—Timber to be cut at Genoa Bay Mill

A despatch from Victoria, B.C., states that the Cameron Lumber Company of Victoria in conjunction with the Empire Lumber, also of Victoria, has secured a contract from the Dominion Government for the production of 24,000,000 feet of timber to be used in the construction of the new harbor works at Toronto. The contract involves over \$250,000 and delivery must be completed within four years. This is a contract which constitutes a record in the lumber business and it is considered to be a direct result of the approaching opening of the Panama Canal.

According to the despatch from Victoria, the manner in which the contract for the timber finally reached the Cameron Lumber Company and the Empire Lumber Company is interesting. The despatch states that the contract from the Dominion Government for the construction of the harbor works was originally let to the Canadian Stewart Company of Toronto. A branch of the James Stewart Construction Company of New York. This firm sub-let the contract for the supply of timber to the Robert Dollar Steamship Company of San Francisco, who operated a line of tramp steamers from the Pacific Coast. The Robert Dollar Steamship Company sub-let the contract for timber to the Empire Lumber Company, which has recently commenced to develop its large holdings in the neighborhood of Cowichan Lake on Vancouver Island.

The Empire Lumber Company is planning to build one of the largest mills on the coast, at Crofton, B.C., in the near future. They have sub-let the contract to manufacture the timber, to the Cameron Lumber Company. Messrs. J. O. & D. O. Cameron of this firm are the owners, together with Messrs. R. T. & G. R. Elliott, of the Genoa Bay Lumber Company, whose plant is located at Cowichan Bay, on Vancouver Island. The timber will be manufactured at this mill, which has a capacity of 125,000 feet in ten hours and is one of the most efficient mills to be found in Canada. The equipment of the mill is such that it can take timbers up to 100-foot lengths.

The contract includes over 35,000 timbers 40 ft. long and 12 in. square. Work upon the contract will be commenced without delay. The mill at Genoa Bay was recently closed down temporarily so as to undergo a thorough over-hauling before commencing upon this contract. The timber will be taken from Cowichan Lake to tidewater on a

new line of the E. and N. Railway which has recently been completed. It will then be towed around to Genoa Bay, a distance of about 12 miles.

The timber limits of the Empire Lumber Company are located near the north end of Cowichan Lake and contain many thousand acres of the finest timber on the Pacific Coast.

Information recently secured is to the effect that the first shipments of these timbers from the Genoa Bay mill will be brought across Canada by rail. As soon as the Panama Canal is opened the balance of the shipments will come by that route. The Dominion Government already has an inspector on the ground whose duty it will be to pass upon all the timber before it is shipped from the mill.

The Empire Lumber Company, from whose limits the timber for this contract will be secured acquired their limits, amounting to 53,000 acres, from the E. and N. Railway in 1909. The company is a subsidiary corporation of the American Finance & Securities Company of New York City, and is capitalized at \$7,500,000. Mr. W. E. Marsh of New York is president of the Empire Lumber Company, and Mr. C. C. Yount is vice-president and general manager.

A meeting of timber licence holders of British Columbia was recently held at the offices of the British Columbia Lumber and Shingle Manufacturers' Association, at which Mr. M. S. Logan, who represented the licence holders at Victoria during the progress of the recent legislation affecting royalties on timber, made a report. The meeting was private, but it was stated subsequently that those present expressed their approval of the bill as finally passed. Although they had not secured everything they desired, they felt that the government had dealt fairly with the industry and that the result of the new regulations would be beneficial to the industry of the province.

The new tariff for trans-Pacific lumber freights from Victoria, Vancouver, Puget Sound and Portland became effective on March 1st. It represents a reduction of \$1 per thousand feet. Lumber 1 in. x 12 in. x 40 ft. will be carried at \$8 per thousand feet. For 14 in. x 14 in. not exceeding 40 ft. in length, the rate is \$9 per thousand feet. For timbers between 40 ft. and 50 ft. in length, the rate is \$10, per thousand feet and for lengths exceeding 50 ft., \$11 per thousand feet.

Where Toronto Harbor Timbers will be sawn—Genoa Bay Lumber Company's plant at Cowichan Bay, B. C.

Electric Drive in a Large B. C. Sawmill

Plant of E. H. Heaps & Co. Fully Equipped for Operation by Electricity—Detailed Description of Machinery and Buildings

The advantages of electrical drive in lumber mills have of late been more generally recognized by millmen, and it has been adopted in many of the lumber mills erected during the last few years. Experience shows that it possesses the advantages of efficiency and economy and practically eliminates line shafting and belting, thus reducing the up-keep expenses to a minimum. The important features in connection with electric drive are the ability to locate the machinery where most convenient to avoid rehandling the lumber, and to operate any group of machinery or any individual machine at any time.

That isolated electrical power plants in connection with lumber mills, where fuel is available at practically no expense, have proven a commercial success, is an undisputed fact. A suggestion a few years ago that met with a good deal of incredulity was that in the near future the central station would be supplying power to operate lumber mills. This phase of the question has received an increasing amount of attention, however, and judging from the number of mills already receiving power from central stations, it is fair to assume that, where an uninterrupted service is available it possesses many advantages worth investigating by millmen.

Model Plant and Equipments

A description of the modern electrically-driven saw and planing mill erected by E. H. Heaps & Company, Limited, at Ruskin, B.C., tends to substantiate the statement that the central station has entered the field and is apparently meeting with success. The plant and town site, occupying an area of 152 acres, enjoy an extremely favorable location, having frontage on the Fraser River and being bounded on the east by the Stave River which affords absolutely ideal facilities for holding logs. The plant commenced cutting early in 1913, running in the main side only. When completed it will have a daily cutting capacity (10 hours) of approximately 250,000 feet of lumber, 500,000 shingles and 50,000 lath.

The sawmill is housed in a three-storey building, which is 402 feet long and has a width of 110 feet in one part. Its narrow portion is 64 feet wide. One side was operated for several months last season, and the second side will be fitted up in the near future as a short log mill, the machinery for which is now on order. The sawing machinery at present installed consists of a 10-ft. Allis single cut band, an 84 x 12 heavy Allis Pacific Coast edger, 7-foot Mershon band resawing machine, automatic air trimmers, slab slashers, etc., and a Stetson Ross automatic sizing machine. The mill is also equipped with the latest Simonson log turners, kickers, automatic transfers, etc. The planing mill occupies a building measuring 121 x 134 feet. Arrangements have been completed for the construction of the shingle mill, 35 x 120 feet, and a lath mill, in time to cope with the early summer trade. The erection of the shipping-shed 70 x 120 and a large dry stock shed, will also be proceeded with during the early spring. Six dry kilns will be required to handle the mill output, three of these being now almost completed. The kilns are of the North Coast type, and will occupy a total space of 720 x 120 feet with stone foundations, brick walls and concrete roofing.

Source of Electric Power Supply

The Western Canada Power Company at the time plans were prepared for this mill, were supplying the power for 11 motors aggregating

Slasher with Direct Connected Motor Drive

gating 335 h.p. in connection with the E. H. Heaps & Company's new planing mill at Cedar Cove, Vancouver, B.C. The power at Ruskin is also bought from the Western Canada Power Company, who have erected a fireproof sub-station on the company's mill premises. The power is received here from the generating centre, about 7 miles distant, at a potential of 12,000 volts. It is controlled by a hand operated automatic overload G.E. oil circuit breaker, mounted on an iron frame work. From here it passes to three 12,000/400 volt Allis, Chalmers, Bullock o.i.w.c. transformers of 333 1/3 kw. capacity each. Space is also provided for another bank of three transformers of the same capacity. The power is transmitted from the transformers to the main switchboard in the mill by temporary mains consisting of three 1,000,000 c.m. cables.

Switchboard and Panel Equipment

The main switchboard is of special design and was built at the mill. It consists of four panels of 2-in. blue Vermont marble. Two panels are each 24-in. wide and two are 30 in. wide, giving a total width of 9 ft. The board stands 7 ft. 6 in. high and about 5 ft. from the outside wall.

On the first panel, which is 24 in. wide, are mounted:—one 7½-in. Wagner, 110 volt, a.c. voltmeter; one 7½-in. Wagner, 500 a., a.c. ammeter; one 400a, 250 v., d.p.d.t. knife switch; eight 50a, 110 v., d.p.s.t. knife switch. On the second panel, also 24-in. wide, are mounted:—one 7½-in. Wagner, 600 v., a.c. voltmeter; one 7½-in. Wagner, 2000 a., a.c. ammeter; one 2000a, t.p.s.t., type E "Condit" oil switch. On each of the two 30-in. panels are installed two 500a, t.p.s.t., automatic, "Condit" oil circuit breakers.

There are at present four distributing panels. Panels Nos. 1 and 2 are each controlled by one 500a circuit breaker on the main switch-

Motor Drive for Band Mill

Edger, with Direct Connected Motor Drive

board. Panels 3 and 4 are controlled from one 500a circuit breaker, leaving one circuit breaker for future extensions to the mill.

Panel No. 1 consists of the following fuse blocks,—2 sets of 401-600a; 2 sets of 201-400a; 4 sets of 61-100a; 8 sets of 31-60a; 2 sets of 0-30a. This panel is of 1-in. marble, is 8 ft. 8 in. long and 2 ft. 6 in. high and completely enclosed in steel cabinet. All the fittings on same are polished copper and back connected. There are at present controlled from this panel the following motors, all belt connected to their machines,—

H.P.	R.P.M.	Type	What Drive
300	900	Slip ring	10-ft. Allis band mill.
40	1200	Squirrel cage	54-in. jump saw.
30	1200	Squirrel cage	Log haul.
20	1200	Squirrel cage	Conveyor.
15	1200	Squirrel cage	Conveyor.
10	1200	Squirrel cage	Roll case.
10	900	Slip ring	Conveyor.
7½	1200	Squirrel cage	Trout set works.
7½	1200	Squirrel cage	Canting gear and rock saw.
5	1200	Squirrel cage	Filing machinery.

Panel No. 2 is also of 1-in. marble, 4 ft. 8 in. long and 2 ft. 6 in. high. Fuse blocks are polished copper and back connected and consist of the following sizes:—1 set of 401-600a; 1 set of 101-200a; 4 sets of 61-100a; 2 sets of 31-60a. The following motors are at present controlled from this panel; the first two machines are direct connected,—

H.P.	R.P.M.	Type	What Drive
200	1200	Squirrel cage	84-in. Allis-Chalmers edger.
75	860	Squirrel cage	10-48-in. slasher saws & chains.
20	1200	Squirrel cage	Transferer.
20	1200	Squirrel cage	Transferer.
10	860	Slip ring	Conveyor.

Panel No. 3 is of 1-in. marble and front connected; fuse blocks are as follows,—1 set of 401-600a; 3 sets of 101-200a; 2 sets of 61-100a; 4 sets of 31-60a. The following motors are at present controlled from this panel; the saw trimmers are direct connected,—

H.P.	R.P.M.	Type	What Drive
150	850	Squirrel cage	7-ft. Mershon resaw and transfer chain.
50	720	Squirrel cage	24-in. saw trimmers & transfer chains.
20	1800	Squirrel cage	2 cut-off saws.

15	1200	Squirrel cage	Roll cases.
10	1160	Slip ring	Conveyors.

Panel No. 4 also of 1-in. marble and front connected, contains,—4 sets of 201-400a; 7 sets of 61-100a; 2 sets of 31-60a; 1 set of 0-30a. The following motors are at present controlled from this panel; the sizer and pony edger are direct connected,—

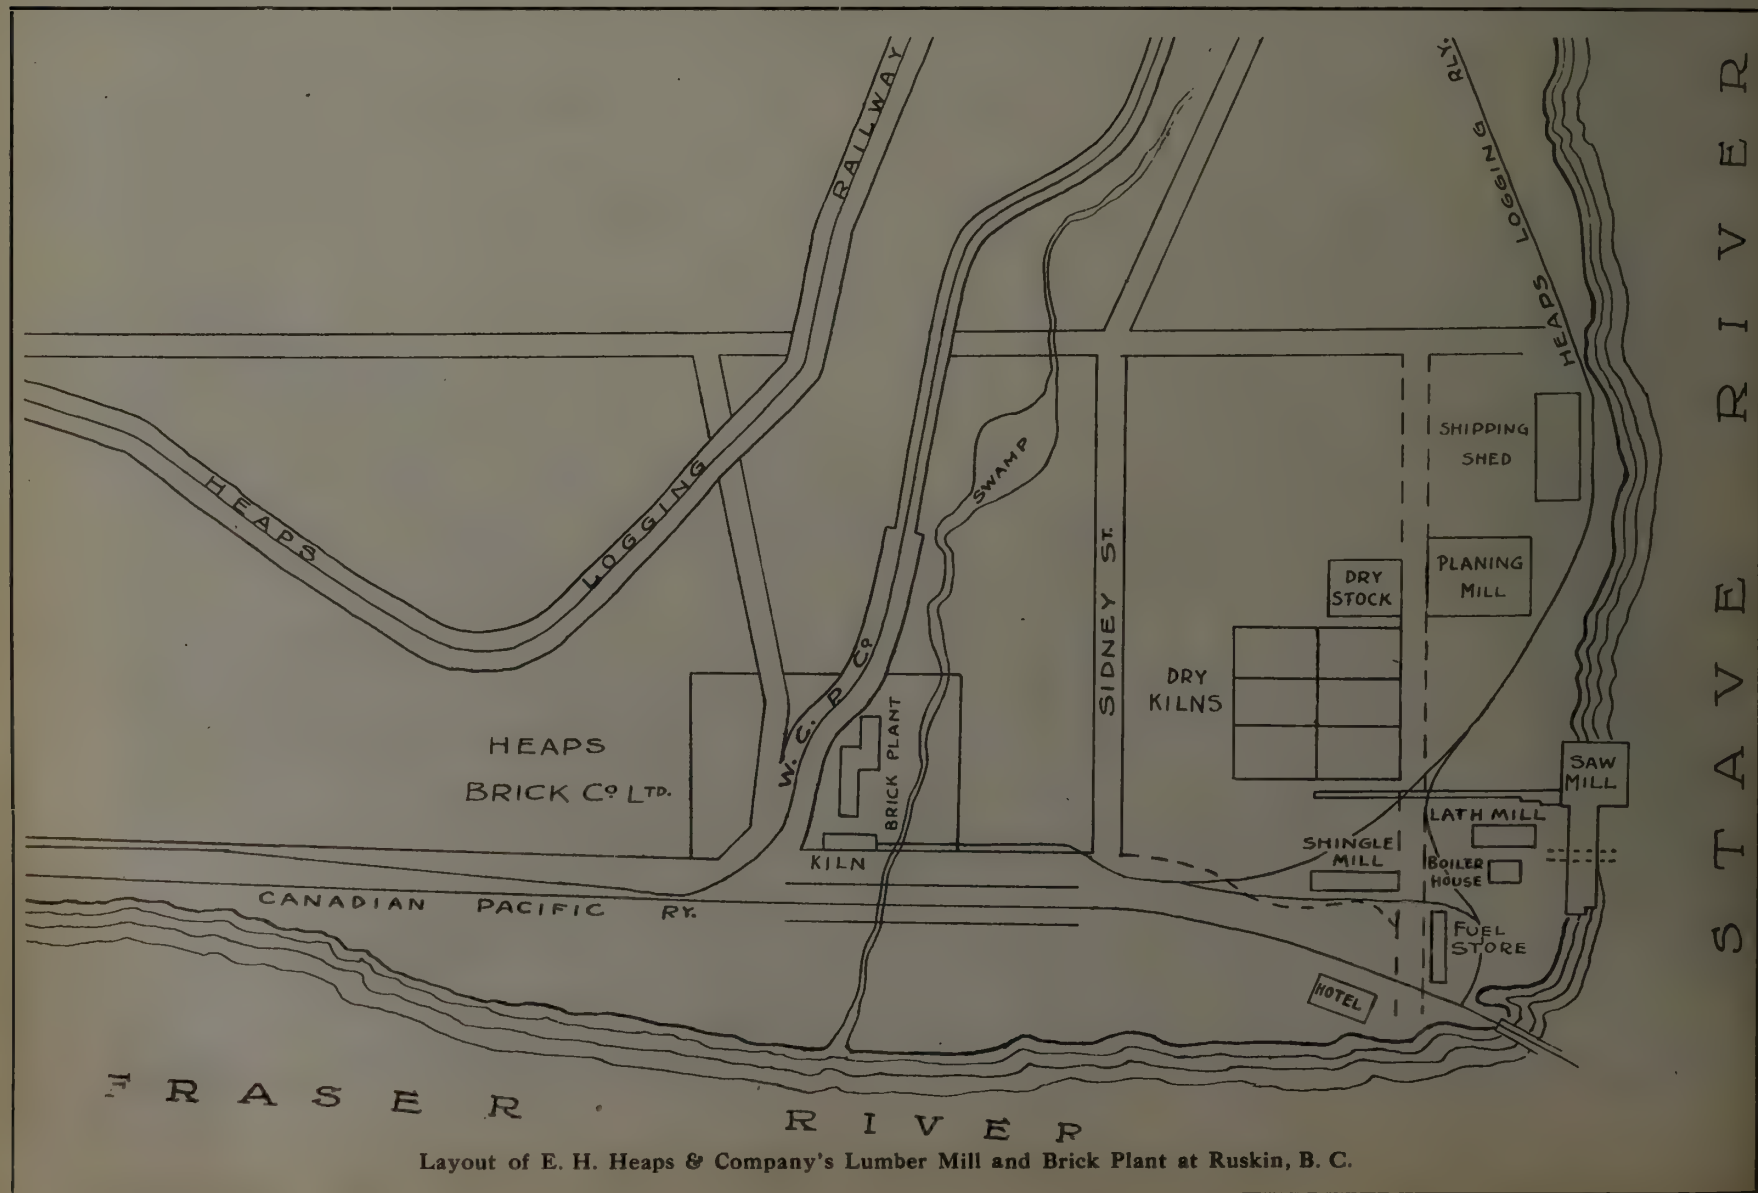

H.P.	R.P.M.	Type	What Drive
50	900	Squirrel cage	Stetson & Ross sizer.
40	1200	Squirrel cage	Roll cases.
30	1200	Squirrel cage	Roll cases.
30	1200	Squirrel cage	Roll cases.
30	1200	Squirrel cage	Fan.
20	1800	Squirrel cage	Pony edger.
20	1200	Squirrel cage	Roll cases.
20	1200	Squirrel cage	Sorting table.
10	1200	Squirrel cage	Conveyor.

The Planing Mill

The planing mill, which is situated some distance from the saw mill, is supplied direct from the 440 volt busbars in the sub-station. Current is controlled by an 800a knife switch and fuses. The cables are installed under the gangway to the planing mill, entering the mill through an 800a knife switch and fuses to a slate panel 8 ft. long and 4 ft. high, front connected and containing the following fuse blocks,—1 set of 401-600a; 1 set of 201-400a; 4 sets of 101-200a; 2 sets of 61-100a; 4 sets of 31-60a; 2 sets of 0-30a. The following motors are connected from the panel; the matchers, moulder, sticker and cut-off saws are direct connected,—

H.P.	R.P.M.	Type	What Drive
75	800	Squirrel cage	Blower fan.
50	1200	Squirrel cage	6 x 15 matchers.
40	1200	Squirrel cage	6 x 15 matchers.
40	1200	Squirrel cage	Berlin resaw.
30	860	Squirrel cage	15-in. wood moulder.
30	850	Squirrel cage	12-in. sticker.
10	1200	Squirrel cage	Rip saw.
5	1200	Squirrel cage	Grinding machinery.
3	1800	Squirrel cage	Swing cut-off saws.
1	1800	Squirrel cage	Knife grinders.

All wiring for power and lights is in conduit, and is carried be-

Layout of E. H. Heaps & Company's Lumber Mill and Brick Plant at Ruskin, B. C.

neath the floor wherever possible to avoid interfering with machinery repairs or alterations. Distribution panels are placed at the most economical points, viz.—close to the largest motor or group of largest motors that each panel controls. The lighting is 110 volt a.c. multiple. Eight distribution panels are carefully located on the different floors, each controlled by a knife switch and fuses on the switch-board of the lighting panel. Each circuit is controlled by a knife switch and fuses and 8-16 c.p. lights is the maximum per circuit. Over sorting tables, carriage edger, slasher, trimmer and live rolls, lights are placed in an inverted trough painted white. The mill having been whitewashed throughout, very little light is absorbed by the walls. The efficiency of the lights is thus greatly improved.

All motors in the sawmill are of Allis-Chalmers-Bullock make. The band mill motor is a three-bearing type. The motors in the planing mill over 5 h.p. are of Allis-Chalmers make. Starters are provided with no voltage release. Motors of 5 h.p. and below were supplied by the Canadian General Electric Company. Every single motor in both mills is protected by a Conduit oil circuit breaker.

Mr. Louis Brodeur, electrical engineer and contractor, of Vancouver, had charge of the complete installation. Mr. G. Lewthwaite, steam and electrical engineer, is now in charge of the steam and electrical plant.

Some Additional Items of Interest

The exceptionally heavy type of construction followed in the erection of the sawmill building is an outstanding feature. The main timbers are 14 x 16 in. with 10 x 12 in. brace supports. The clearance between floor and ceiling of each storey is 12 feet. Hundreds of piles were driven for the foundation, thus assuring the utmost degree of solidity and stability.

The filing room, which is located in the third storey, is 64 x 69 ft.

The original intention was to erect a large water-jacket burner west of the log haul to consume the mill refuse, but this plan was discarded in favor of an overhead conveyor which will carry all mill waste to the furnaces of the brick-making plant about two hundred yards away, thus solving the problem of cheap fuel—a vital point in the production of this class of building material.

The finishing mill is located on the lower floor of the sawmill, so that timber may be taken off sorting table and handled quickly and economically.

On the east of Stave River side of the mill, space has been provided for the equipment required to cut blocks from the log for the shingle mill. The blocks will be dropped into the refuse conveyor for delivery to the shingle machines.

Lumber received from the trimmers is first handled in the extension on the east side of mill. The stock then passes to log haul end of mill and thence out to the sorting table.

The timber decks at the rear end of the mill are specially equipped for the quick handling of all lengths. After passing through the ready sizer the timbers are delivered alongside of the car loading platform.

For a number of years past E. H. Heaps & Company have maintained a large boarding house and general store on the waterfront at Ruskin for the convenience of their employees and residents of the district. When the new plant is in full operation, the population of the town will be close to 1000, which will necessitate the erection of a number of new dwellings. Several streets in the townsite were graded last fall, in anticipation of building operations being commenced early this summer.

A start was made last fall on the work of levelling the ground between the sawmill, brick plant and other buildings. A steam shovel will speedily cut down the half-dozen hillocks, the soil from which will fill up hollows elsewhere.

The construction of a government wharf at Ruskin has been ordered, and will prove a great convenience to the company and residents. The wharf will be erected on the Fraser River frontage below the hotel and general store, and will be a substantial structure. The company's railway line will be extended from the mill yard to that point, so that lumber may be shipped on barges to New Westminster, Vancouver and elsewhere.

For years past E. H. Heaps & Company, Limited, have owned and operated extensive limits up the Stave River Valley, the timber being described as some of the best in the province. The timber is delivered to the mill boom over the line of the Ruskin Logging Railway, which is owned by the company. Already having a considerable mileage of standard gauge track, a large amount of money was expended in 1912 on main line betterments and the construction of branch lines into the timber, as well as the addition of new equipment. Oil burners were also installed in the locomotives and several of the donkey engines, with gratifying results. Over 350 men are employed in the firm's logging camps when operating at full capacity. Edward Heaps is superintendent of this important branch of the firm's business, as well as manager of the Ruskin plant.

Following the erection of the new plant the route of the railway

through the mill site was changed materially. Tracks now serve the brick plant, as well as the loading platforms of the sawmill, shingle mill, planing mill, shipping shed and dry stock shed. The switching of cars to and from the C. P. R. main line, paralleling the townsite, will be done by one of the company's locomotives.

Spruce Waste Available for Pulp

Two Bangor, Maine, men, one a civil engineer and the other a sawmill operator, have perfected a process for the removal of bark from mill waste, which they claim will render the vast quantities of spruce and other slabs and edgings produced by lumber mills, and now of little value, available for the manufacture of wood pulp of the highest grade. The process has been patented, and it is proposed to form stock companies for the purpose of erecting plants at Bangor and other important mill centers in Maine and Canada for the treatment of waste wood and its preparations and baling ready for shipment to pulp mills.

The new process consists in the subjection, first, of the waste wood to streams of boiling water driven at 250 pounds pressure against the material as it is passed through a cylinder or tube. This softens the bark and dissolves the resinous matter by which the bark is firmly attached to the wood. The heat of the water and its great force effectually loosen the bark, and the removal is completed by friction with lugs or spurs. A few shreds may remain attached to the wood, and these are removed by passing the material through an ordinary pulp wood tumbler, where the work is completed by friction. The wood then goes to the chippers and is baled for shipment. Previous to hot water treatment the wood is passed under rolls and drag knives which to some extent loosen and scarify the bark, thus hastening the action of the water.

About 1,000,000,000 feet of logs of all kinds are cut in Maine every year, and of this quantity 800,000,000 feet is spruce. Of the vast spruce harvest, 400,000,000 feet goes to the sawmills, pulp mills taking the other 400,000,000. Careful estimates place the waste of spruce in the process of manufacture into lumber at 45 per cent., or 180,000,000 feet annually. A few mills are so situated that some of their waste can be utilized, either as fuel for the mill furnaces or by sale to wood dealers in cities and towns, but it is said that fully 75 per cent. brings little or no revenue, while often it is disposed of at considerable expense in the maintenance of burners erected for the purpose.

At present the pulp mills of Maine are drawing heavily upon the timber supply of the State and are importing wood from the Maritime Provinces of Canada. Such is the drain upon the Main timberlands that trees are being cut that would have been allowed to stand in former years, and in that way the future supply is threatened. Statistics of the Penobscot and Bangor booms show that while twenty years ago only seven logs were required to make a thousand feet, board measure, the sticks have lately been running as small as thirteen to the thousand. From this, it is argued by the inventors of the new barking process that the success of the enterprise would not only mean the utilization of a vast quantity of material that now is valueless, but would also be the means of arresting to a considerable extent the stripping of spruce lands of small trees.

If the estimates of mill waste are at all accurate, and 45 per cent. of the log goes into the waste heap, then 180,000,000 feet annually of Maine's spruce supply is of little use except as fuel. If 75 per cent. of this, or 135,000,000 feet, is altogether useless, and can be made valuable by the new bark removal process, then, at the lowest price paid by pulp manufacturers, this by-product would yield a sum sufficient to make its treatment highly profitable and afford the mill operators a new revenue that would tide them over many a dull season. It is said that a bark-removal plant capable of turning out 200 cords of pulpwood daily can be erected for \$30,000, and that several will be built at once.

A New Brunswicker's View About Panama Canal

A view of the probable effect of the Panama Canal on the Atlantic Coast lumber trade, particularly in the New York and New England markets, was expressed recently by A. Fraser, of Fredericton, New Brunswick, who has been on a trip to the Pacific Coast looking into market conditions. Mr. Fraser is at the head of the Fraser Lumber Company, Limited, which is one of the largest concerns in Eastern Canada, shipping large quantities of lumber to markets in which B. C. fir promises to be a sharp competitor. Mr. Fraser visited the West Coast to get first hand information regarding conditions and to learn what preparations are being made to ship to New York and New England. Mr. Fraser gave it as his opinion that the principal effect of fir lumber in Atlantic Coast markets so far as the Canadian mills are concerned, will be to keep prices at a lower level than would otherwise prevail. As a result of the diminishing supply of New Brunswick and Nova Scotia timber, values normally would tend to advance, but this advance could hardly be expected to take place in the face of the new competition of west coast woods.

Labor Statistics of Ontario Lumber Industry

The tables reproduced on this and the adjoining pages are from the report of the Ontario Bureau of Labor for the year ending December 31st, 1913. They show, in an interesting form, the results of the operations in sawmills, planing mills, sash and door factories and woodworking factories, and afford valuable statistics from which to make comparisons in connection with individual industries. It is interesting to note that the largest lumber manufacturing concern making a report, which has a capital investment of \$2,500,000 produced material with a gross value of \$3,418,000. Its average weekly wage was almost the highest paid in the industry, being exceeded only by two others. The wages paid by this company increased during the year by 17½ per cent. A close study of these tables will be found interesting to practically everyone engaged in the manufacturing and working up of lumber products.

An Attractive Millwork Catalogue

A very attractive catalogue of stock millwork specialties has been issued by the Wm. Rutherford & Sons Company, Limited, Montreal, P.Q. The book is published in substantial form with cloth binding and is extensively illustrated. It contains also a valuable assortment of general information regarding lumber and lumber products, as well as a generous amount of blank memoranda pages which are

added at the end of the catalogue. The arrangement of the catalogue is designed in such a way as to make it very serviceable to buyers. It will unquestionably save them much money and thought. All the goods illustrated in the catalogue are "stock" and can therefore be furnished much more cheaply and delivered more promptly than special detail work. The company, however, operate a large plant running all the time on special detail work and are in a position to meet every requirement in wood products. A very complete index is published in connection with the catalogue, which together with the illustrations and information, make it one of the most valuable of its class that has ever been published. The Wm. Rutherford & Sons Company, Limited, are representatives in Eastern Canada for the Paine Lumber Company, Limited, Oshkosh, Wis., a copy of whose catalogue, embracing 150 door designs will be furnished free to architects and dealers.

Sixty million feet of timber and 42 thousand poles are offered by the U. S. Government on the Kaniksu national forest near Priest Lake, Idaho. The timber is said to be of excellent quality and all of it lies within four miles Priest Lake, so that it is readily accessible and can be easily examined by prospective purchasers before the date on which bids are closed, June 1. Except for the pole material, which is cedar, the principal species are white pine and yellow pine. The timber now occupies some 5,000 acres.

Results of Ontario Timber Sale

The Ontario Government sale of limits in the Mississauga Reserve which was held by tenders received up to February 27th, resulted as follows:—

Berth "B," 36 miles, was sold to the Spanish River Mills Company. Standing pine \$6.55 per thousand feet B.M. Blown down pine \$3.15 per thousand feet B.M. Both in addition to dues of \$2.

Berth "N," 36 miles, was sold to Booth & Shannon. Standing pine \$5.05 per thousand feet B.M.; blown down pine \$2.05; both in addition to dues of \$2.

Berth "K," 36 miles, was sold to the Spanish River Lumber Company. Standing pine \$3.25 per thousand feet B.M.; blown down pine \$1.25; both in addition to dues of \$2.

Berth "M," 36 miles, was sold to Spanish River Lumber Company. Standing pine \$6.55 per thousand feet B.M.; blown down pine \$3.15; both in addition to dues of \$2.

Berth "O," 36 miles, was sold to the Massey Lumber Company. Standing pine \$5.15 per thousand feet B.M.; blown down pine \$1; both in addition to dues of \$2.

Burwash Lake was sold to the Aird Island Logging & Trading Company. Standing pine \$7.15 per thousand feet B.M.; blown down pine \$3.25.

Joints for Belt-Sander Belts

Making a joint in the belt on a belt-sanding machine is a matter of great importance for the probable operation of the machine. The chief points to be sought in such a joint are discussed by W. S. McConnell in an article in the Abrasive Age, published by the Carborundum Company, Niagara Falls, N.Y., from which the following extracts are made:

First of all, it is essential that the joint shall not break or become loose, or tear out. Secondly, the joint must be so made that the belt can be run in either direction and must be as thin and flexible as possible. Having given this subject a great deal of attention, I have found that a butt joint, reinforced with cloth, produces very satisfactory results.

It is optional whether this joint be square or on an angle, but I believe I am safe in saying that a joint cut on an angle is the most popular for belts up to eight inches in width. For reinforcement, a cloth having the same thickness and texture as that used in making flour bags, is preferable, while for wider belts, a cloth similar to that used in making overalls, is satisfactory. Of course, the starch should be washed out of the cloth before it is used.

For a joint on a belt six or eight inches wide, the width of the cloth should be about three inches. First of all, cut the paper to the right length and then bring the two ends together, tacking them down on a board, grain side down. Then apply the glue to the paper, having the cloth about three inches longer than the width of the paper.

Place this cloth over the glue, and then take two pieces of veneer, three inches long and two inches wide, and with these scrape all the surplus glue out of the joint, being careful to remove all wrinkles. This scraping forces the glue into the paper and through the cloth, producing the flexible joint so much desired.

The selection of cloth for making the belt joints, and the scraping of the surplus glue out of the joints, are two points far more important than the average sanding machine operator is willing to concede.

After the wrinkles and the surplus glue have been removed, place a piece of newspaper over the cloth, and then lay a board on top before putting between clamps to dry. When thoroughly dry, the edges of the joints should be trimmed.

A good method is to make enough belts on Saturday to last through the following week, and after being made they should be hung up on pegs ready for use. In no case should they be rolled up in small rolls, for it is almost impossible to roll a sanding belt without cracking and weakening it, which shortens its life considerably. Any good hide glue will answer for making joints providing it is of the necessary consistency.

After a new belt has been run for a few hours, it should be removed, turned around and then run in the opposite direction. This will add to its life as well as its cutting qualities, and is a practice followed by all experienced operators.

On belts that are 15 or 18 inches wide, or even wider, and which are used on what is called the table type of belt-sander, the joints are often cut in V-shape or rather having point well rounded more like U, or a modification of these. Where this style of joint is used, it is necessary to make a templet to cut by; outside of this its construction is the same as that of the joints described, and there are numbers of operators who claim wonderful results from this type of joint.

Joints made on cloth belts, in the woodworking trade, are commonly known as lapped joints. These are made by removing the grain from one end of the belt and applying the glue, while the other end is

brought up and clamped down on the glued edge. The grain is removed by moistening and scraping.

If left to dry by itself, the cloth will wrinkle, and this can be overcome by having a flat piece of iron heated and used to lay on where the grain has been removed, using this iron in the same manner as you would a flatiron.

If trouble is experienced by a joint drawing during the drying process, this can be overcome by placing a strip of wire fly-screen on the cloth side of the joint when putting it in the clamps to dry. This wire screen will come off easily when the joint is removed from the clamps.

The same joint as used on paper belts may also be used on the cloth belts. Users of the cloth belts in the woodworking trade generally buy their cloth in 14-inch rolls, using this for belts 14 inches wide and then tearing into various widths to meet other requirements.

Trade Outlook at Brantford is Fair

Editor Canada Lumberman: Brantford, Ont., March 21st.

For the year just ended, our business shows a falling off of ten per cent. in volume. The outlook at the present time is fair. There are quite a number of buildings to be put up as soon as spring opens. As regards collections, we have been very fortunate, and in this connection everything is in good shape. The prices of stock are about the same as they were a year ago. We are not carrying quite as much stock as we did a year ago. It is about fifteen per cent. less.

The farming community seem to have plenty of money, and the only parties with whom we have any difficulty whatever, are a few speculative builders.—The Schultz Bros. Company, Limited.

A Time to Smile—But also Watch Conditions

Editor Canada Lumberman: Toronto, March 23rd.

Business is not up to that of last year, for two reasons, weather and finance.

The outlook is fair to good, but does not warrant any business extensions.

The price of stock is steady, but will not advance, and on hemlock is sure to fall slightly, when the new cut is ready for shipment. Farm trade is steady and will be up to that of previous years on account of the good returns obtained by farmers last year.

It is a time to smile, but not forget the financial, political and economic conditions which are below par.—W. C. Charters.

All is Encouraging at Acton, Ont.

Editor Canada Lumberman: Acton, Ont., March 24th.

Our business for March of this year exceeds that of any previous year. The outlook is good for the coming season. Collections are up to an average. Farmers are prosperous and their credit is A1.

The town of Georgetown is having a steady growth with all industries working. Fourteen houses are already under contract to be erected this year and many more are talked of. Acton trade is in a good, healthy condition. There will be a heavy cut of hardwood at all the local sawmills.—J. B. Mackenzie.

Berlin Trade Less Active, but Encouraging

Editor Canada Lumberman: Berlin, Ont., March 20, 1914.

The prospects this spring are not quite as promising as last year. We have not as many orders on hand as we had last year at this time, although we expect things to brighten up, because we have been getting a number of new industries that will employ a number of hands, who will naturally require homes. There is an agitation at present for the building of a number of workmen's houses in this city. This will help trade considerably.

We have found collections fairly good during the past year.

The price of stock has shown a slight advance in some of the factory materials but yard stocks are at the same levels as last year.—H. J. Hall & Son.

A resolution was recently passed by the Vancouver Board of Trade, endorsing the action of the Minister of Lands of British Columbia in his endeavor to induce the Canadian Minister of Trade and Commerce to appoint a special committee to investigate the lumber trade, and to assist in the development of the trade in lumber with South America, Africa and Asiatic countries. The Board of Trade took this step at the suggestion of Mr. R. H. H. Alexander, secretary of the British Columbia Lumber & Shingle Manufacturers' Association.

George Matthews, timber buyer of the Chicago, Burlington and Quincy Railway, was in Vancouver recently, arranging for the submission of tenders for 3,000,000 feet of fir timber to be used in the company's shops at Kansas City and Omaha. The fir is wanted because of its strength.

An Electrically Driven Saw Mill

Nearly all the publications devoted to wood-working have given a great deal of space to motor-driven machines, and no doubt most of our readers are familiar with their work on planers, band saws and small circulars. However, I have seen very few articles on motor-driven board saws, or rotary saws, as they are generally called.

On account of the large diameter of the log board saw most manufacturers of motors will not advise using motor drive. Five years ago last fall the writer built a small sawmill, six miles from where our factories are located, in order to saw the logs near where they were cut and to stack the lumber until it was seasoned before drawing same to the factory. It was the intention to install a portable boiler and engine for power.

One day, when driving up to the location to get ready to build, I noticed the electric wires that brought the current to light the village, sixteen miles from where the power was generated by water power. It struck me that if we could get power it would be a great thing, as there would not be as much danger from fire as there would be from a boiler. We took the matter up with the village trustees, who controlled the power plant, and found them very anxious to let power, as they had day service and a very light load. They agreed to let us have power at the rate of 12c per h.p. for ten hours, we to install a 500-volt, 75-h.p. motor.

We went ahead, built the mill and installed a rotary board saw, using 52-in. inserted-tooth saws. In setting up the mill we had the arbor for the saw made 13½-ft. long, so we could set the motor outside of saw frame and belt to same. We had a bull wheel similar to a hoisting rig, with a 36-in. spur and drum, 16-in. diameter, and a 7-in. pinion. The pinion shaft had a 30-in. pulley and was belted to the board saw arbor to a 10-in. pulley, with a tightener to raise and lower, as it was desired to draw the logs up the slip, which was done with a ½-in. wire rope.

We sawed as many logs as possible from the ways as they were

Layout of an interesting electrically-driven Sawmill

rolled into the mill, and the balance were left in rollways extending 250 ft. back of the mill. When the ways were clear of logs we used the cable to draw them from the piles to the mill, saving the expense of a team, which is usual around most portable mills.

The motor which we installed was 75 h.p. and was set under the mill 5 ft. below and 13 ft. from the board saw arbor and belted from motor to arbor. Underneath the saw was constructed a sawdust carrier, which we find in most cases more desirable than a blower, as it takes less power to drive. This carrier was belted from board saw arbor to shaft below, using a pair of spur gears to reduce the speed of carrier, which extended 100 feet beyond the rear of the mill. There is also a 20-ft. shaft running lengthways of the mill, which is belted by a quarter-twist belt from the saw arbor. At the other end of this shaft is a slab saw, which swings up between the rolls and cuts the slabs 16 feet long, and they drop through the floor into the dump sled, where they are drawn out to be piled.

We started this mill up and sawed all winter and it did fair work, but found the motor would lag when saw was in a large log, making the power very unsteady, partly due to the governor on the water wheel where the power was generated, and the balance due to there not being power enough to keep up the speed in large logs. It also had a bad effect on the lights in the village six miles away. We sawed out a little more than 1,000,000 feet the first winter.

When we started up the second winter the people in the village where the power was owned put up a great kick to the trustees and we expected the power would be taken from us. We asked for time to try a balance wheel, which was installed under the mill near the motor, belting back from saw arbor, which runs 750 r.p.m. The balance wheel is 5 feet in diameter and runs 4,500 feet per minute, rim speed. The belt from the balance wheel is quite slack and a tightener pulley is on top of same. We found, after we got started, that when we struck a large log the tightener would descend and the balance

wheel gave us power enough to drive it through without lagging enough to be noticed. The result was we were allowed to use the power, as it did not affect the lights as formerly and caused no inconvenience to the people.

The logs sawed are spruce, fir, hemlock, bass, birch, beech, ash and maple, and any lumberman knows what it is to saw mixed logs in hard winter weather. I have had a great many letters from other mill men who had installed motors and had their troubles, and sent them a sketch showing how I installed my balance wheel. Since then I have received letters from them thanking me for the information and saying they had adopted my idea and were getting fine results.

Our experience shows it is far better to install a large motor. It costs a little more for the motor, but less for the current. After running this mill four winters we installed a 100-h.p. motor, and find the cost per thousand feet less than before. I have gone into all the details of showing how this mill was constructed, as some condemned my method of belting everything from the board saw arbor, which had four bearings, but our five winters' work has proved to me that this is a success, and the mill is still running.

Following is the expense per thousand feet, log scale, for manufacturing lumber and lighting the mill:

Winter of	per 1,000 ft.	Electric power per 1,000 ft.
1908 and 1909	\$2.69	\$.43
1909 and 1910	2.33	.44
1910 and 1911	2.80	.46
1911 and 1912	2.53	.41 7/10
1912 and 1913	2.70	.23

The first figures include the electric power, but I have also given cost of the electric power per thousand feet separate, so the reader can see what it would cost him by comparing the price we pay per horse-power with what he can purchase it for. Our operating expense included all the labor, such as scaler, log-rollers and staking the lumber, and has proved very satisfactory, as there is no engineer or watchman to pay and we are able to sell the sawdust and slabs. Out of five small mills that we are running, this electric mill is the best paying of them all. If I were setting up a new electric mill I would have a motor built with shaft extending out on opposite side of the pulley, so I could place the balance wheel on same and have an outer bearing to support it. It would give the same results that I am getting now, but with less shafting and pulleys. Our last year shows only 10c per thousand feet less than 1911, but there is an advance in labor, which makes the difference. E. E. D., in the Wood-Worker, Indianapolis.

Liverpool and Manchester Stocks

Stocks of spruce, pine and birch at Liverpool and Manchester on March 2nd are reported by Messrs. H. W. Lightburne & Company, Liverpool, as follows:—

In oiling machinery, particularly the bearings of cutterheads and spindles, I always make it a rule to see that it is done ten or fifteen minutes before quitting time, says an old hand. The bearings are then warm and will easily take oil and be ready to start promptly the following morning at the sound of the whistle. It doesn't take any more time to oil the machines this way and the possibility of hot boxes is considerably less. Bearings that are oiled in the morning when they are cold, I have found to be much more likely to run hot than bearings oiled the night before when they are warm.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A Useful Belting Catalogue

An interesting catalogue in booklet form, under the name of "The Main Drive" has been issued by the Federal Engineering Company, Limited, Toronto and Montreal. Belt users of all kinds will find this book of much use in the solution of their belting problems. In all cases where belting is used, either for transmission or for conveyor purposes, the book will prove of interest and value, as it contains a great deal of important information, plainly and briefly put. The Federal Engineering Company, Limited, handle Scandanavia, Lanco Balata and Teon beltings, also Saffron Tanned Leather and Conveyor belts. Interesting descriptions are also given in the catalogue of the material and method of manufacture used in connection with these belts. A large number of illustrations are included and the book also contains valuable information relating to belt lacing, the h.p. transmitted by belts and the driving powers of different varieties of belts.

A Record Cross-Cut Saw

E. C. Atkins & Company, Indianapolis, Ind., have just delivered to the Rodney Burns Redwood Novelty Company of Eureka, Calif., the largest cross-cut saw that has ever been made, so far as they know. This saw is 22 ft. 3 in. long and is finished with the Redwood King pattern of tooth, which is exceedingly long and slender and particularly adapted to sawing that class of timber. The saw was made specially for cutting and falling a redwood tree 20 ft. in diameter. A log 30 ft. long will be cut from this and shipped in sections to San Francisco, there to be formed into a log and stump house as a part of the Humboldt County exhibit at the Panama-Pacific Exposition in 1915.

On account of the excessively large diameter of the tree, it was necessary to order a special saw which would permit of supplying the necessary log without the use of an axe. In the use of a saw of this size, it will be necessary to employ two men on either end. The saw will also be exhibited in connection with the log which will be cut at the Panama-Pacific Exposition.

The accompanying illustrations represent a new departure in the manufacture of swages which is of much importance to all lumber manufacturers. The Breeze-Dennison Company, Newburgh, Ont., who have been in the lumber manufacturing business for many years realized long ago the importance of certain improvements in the design of saw swages and worked upon them until they have now turned out in their own plans a swage which gives them the results which they have been seeking for some time. The chief innovation in this swage consists in a change in the die, which in most types of swages is one solid piece, working on an eccentric principle. In the Breeze-Denison swage the die is made of one solid piece which is slotted in the centre to allow the use of three rollers. The main roller which comes in contact with the sawtooth revolves on the second roller, which in its turn revolves on a third roller. The latter two rollers taking the load and thus permitting the swage roller to revolve easily, thereby entirely eliminating friction.

The swage is also equipped with a new type of clamping screw which works rapidly on a coarse thread sleeve until contact is obtained against the side of the tooth, after which a fine threaded screw comes automatically into play and gives the required amount of clamping pressure. The idea of this feature is to allow the clamping screw to open wide enough to permit the swaged tooth to pass freely between the points of the clamp screws, thus making it possible to slide to the next tooth without having to let go of the handles of the tool. This device also allows the clamping screw to be released without any perceptible effort, thus saving the operator many an injured knuckle.

The chief object which the firm of Breeze-Denison had in mind in getting up this swage was to enable them to obtain stronger corners on bandsaw teeth, and in this way to be able to use much thinner saws in manufacturing their lumber. They have also worked out a swage for use upon circular saws, which will be placed upon the market in the course of a few weeks. A shaper to be used in connection with these swages is also being designed which will be placed upon similar principles in regard to the clamping devices. This also will probably be upon the market in the near future.

Elementary But Important Saw Facts

The Editor of Berlin Quality recently received the following interesting letter from one of his readers:—

"This happened last winter. I was filing a mill in Minnesota last winter, sawing mostly hardwood which came to us on cars. The only trouble I had with my saws was that they soon lost their edge. The logs came onto the deck covered with ice and snow with more or less gravel and grit frozen to them.

"We found by using hot water, furnished by an injector, that practically all the ice and grit could be removed on the car. When the logs were washed clean they were brought into the mill. The saws retained an edge longer and the sawyer had less general trouble. If any other mill has the same trouble I advise them to try this.

"Another time I was called to a certain mill where they were having trouble. When I got there I thought I would have some fun with the foreman, and asked him for a job, not telling him who I was. He asked me if I knew anything about resaws and I replied modestly that I did. Imagine my surprise when he said:

"We are having trouble with our resaw. The man that sold it to us said we could run a saw three months without changing. I've about made up my mind he's a liar."

"I did some general educational work in that mill. The first thing I did was to tell the boss that he, I, nor any other human being couldn't run a saw three months without changing. When I told him the saw should be changed twice each day he thought I was joking. But I proved to him that I knew what I was talking about. The last day I was there they resawed 42,000 feet of 5-4 pine on that resaw in 9½ hours. I heard the other day that that boss was looking for a job. I'm not surprised."

An Important New Departure in Swages and Shapers—By the Breeze-Denison Company, Newburgh, Ont.

Development of Side Heads

The use of hard woods in house-finishing and other lines has been constantly growing for many years, until now nearly every section of the country is contributing some wood of a hard or tough nature for this purpose. The fact that these woods take a handsome natural finish and are more serviceable, especially for flooring, has rooted them so firmly in the popular demand that we doubt if they will ever go out of use. How to work them economically with the tools at hand has, however, been a serious problem with the wood-worker who desired to turn out good work at a fair margin of profit.

To meet this demand and to keep up with the race for supremacy among the makers of fast feed flooring machines, the manufacturers of the Shimer Cutter Heads brought out the line known as the "Shimer Limited." These tools possess many features of special merit and are made with four, six, eight or twelve bits to each head to suit the matcher upon which they are to be used, the feed desired and the kind of material to be worked.

In appearance the "Shimer Limited" series of Cutter Heads resembles the older patterns of these famous tools, but differs therefrom in the method of attaching to the spindle; in the construction of the bit seats; of the bit designed for faster cutting; in the greater strength of the holding bolts, and in the self-centering device which clings to the spindle when drawn up, securing it firmly thereto.

The spindle gripping device is positive and effective in its purpose of holding fast to the spindle, as also in centering the head for

The "Shimer Limited" with Expansion

a more uniform action of the cutters. This is accomplished by having the central bore of the head tapered and having a rotatable cap and nut fitted in the upper portion. Into this bore a taper collet projects, having an upper threaded portion fitting the rotatable nut. When the top nut is drawn up the collet contracts and binds itself firmly to the spindle. This device is simple and effective and one not likely to get out of order. The various parts are made of good steel forgings and the collets are hardened and ground true to size. The entire construction of this tool is the finest, both in workmanship and material.

The bit seats in these heads carry a larger surface, and the bit chambers are of greater depth, to compensate for the new acute angle given to the bits for greater relief to the parts coming in contact with the lumber. The holding bolts have been strengthened several times over by the use of a high grade steel especially made for the purpose.

All cutting bits are of high grade tool steel, tempered to file. They hold an edge exceptionally well in working wood of every class and their circular outlines maintain uniform shapes and patterns of the finished product. No filing or fitting of the parts is necessary other than that required to sharpen the bits, which requires about the same skill as that of filing a saw.

To match flooring at the rate of 150 to 250 lineal feet per minute requires side heads of perfect balance, and of undoubted strength, to withstand the enormous centrifugal strains and the hard knocks incident to matching all kinds of lumber at fast feeds.

The "Shimer Limited" Cutter Heads are made from solid steel forgings of 60,000 lbs. tensile strength, which are shaped under a powerful steam hammer until the grain is further solidified and refined, making a tool of great strength. They are carefully balanced and the bits are jointed to insure all of them doing their share of the cutting.

These tools must be seen at work to be appreciated. Like all Shimer products they are sent on trial, returnable if not satisfactory. Address Samuel J. Shimer & Sons, Galt, Ont., Can.

Advertising by the Retailer

If during the various conventions of the retailers there can be aroused more enthusiasm in advertising and some new and novel ideas generated to help the cause along, it will be a good thing, both for the retailers and for the lumber industry as a whole. Perhaps the one thing the retail lumber trade needs to do more of right now is advertising. Some here and there in the trade have kept fairly alive to this subject and a few have been keenly active in local advertising. Taking the retail trade in its entirety, however, there has not been anything like near enough advertising done.

The manufacturers in various lines advertise both to and for the retailer. They advertise to get the attention and business of the retailer, and then various associations of manufacturers do some general advertising to assist in creating a market for their stuff. Also they furnish advertising literature pertaining to their particular product which the retailer can often use to boost business a little. What the retailer needs to do, however, is to consider his business as a business itself and to figure that it is up to him to do some live, wide-awake local advertising to keep in the game properly. His business is not limited to any one or two products that might be advertised in a way by the manufacturers, but it often consists of a wide variation of products, each of which at times holds particular interest for the buyer in the community, and it is up to the retailer to advertise all of these in the course of the year and advertise his own business continually.

Has Centered Mainly on Houses and Home Building

Much of the advertising work done by the retailer in the past has been centered on houses and home building. A strong feature has been made of house plans and plan books, and these have, without question, contributed considerably to business building. They are still good things, too, as is also the later feature of silos for the farmers. They are not the only things, however, and a share of attention should be given to other matters. It often happens that barn building constitutes a good part of the retail lumber trade during the season. Then there is the broad subject of general farm improvement, which includes poultry houses, stock pens, fences and even pig troughs. There are many things along this line that might be featured in advertising, and by being thus featured would inspire prospective customers with a desire for them. It is seeing things pictured and reading about them and seeing the actual things themselves that begets most of the desire to buy in the world, and an aggressive campaign of advertising with various features of farm improvement should result in the selling of lots of lumber that people might not otherwise think of buying. This is a species of creative salesmanship that helps business all around and there is nothing like live advertising to start the thing going, advertising that contains specific suggestions for farm improvement.

Featuring Drain Tile

Then there is not only lumber, but there are the various side lines carried by the dealer. In the springtime drain tile is a great item in some sections and a proper featuring of this in an advertising way with articles in the local papers about the benefits of tile drainage should help business along considerably. There is the matter of true farm sanitation—quite a live subject to-day which, if handled correctly, should help make a market for cement, sewer pipe and various other side lines to the lumber business. In fact, there are opportunities on all sides to bring out something new and effective in advertising and it should prove worth while for the conventions of retailers to have some experience talks on this subject, to discuss what has been done by various members during the past year and bring out ideas as to what may be done during the coming year.

Playing Up the Sash and Door Purchase

For example, when the retailer places his order for a carload of sash and door stock this is a news item for the local paper that can be enlarged upon by setting forth in detail the kinds and sizes of windows bought, the particular kinds of doors purchased and the reason for the purchasing of them. If this is put in proper shape it is not only interesting news, but it is effective advertising that begins the work of creating a sentiment in favor of the very stock that has been ordered, and this makes it easier to sell that instead of having to order something special all the time for some of the builders. The same idea may well be followed when the retailer places an order for anything special in the way of lumber. Whether it is flooring, siding or barn stock, there can generally be developed some interesting feature in connection with the purchase that may be a good news item and will help keep the retailer and his business before the public in an attractive manner. Then, when something of particular note in the way of farm improvement is done anywhere in the community it makes an interesting item that helps inspire others with the desire to improve. Everywhere there is something of this kind all the time that can be used to keep the advertising game alive and interesting. That is what will perhaps do more good for the retail trade throughout the country than any other one thing—more effective and wide-awake advertising.—St. Louis Lumberman.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-11

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS, Hamilton, Ont. 7-12

Wanted

500,000 feet 1-in., 1½-in. Soft Elm.
700,000 feet 1-in. Basswood, Ash and Birch.
For delivery as soon as dry this year. State what you can supply and lowest prices on cars.
Box 945, Canada Lumberman, Toronto, 3-8

Wanted to Buy

600 Pieces 16-in. average square Birch timber. State best price and when delivery can be made.

Imperial Hardwood Flooring Company, Montreal, P.Q. 7

Wanted

Several cuts of good Maple and Beech to be sawed during Winter and Spring of 1914 in District between Georgian Bay and Toronto, also stocks of Birch from Muskoka District. Box 964, Canada Lumberman, Toronto. 4-7

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Wanted to Buy

4/4 White Basswood.
4/4 12-in. and over wide Soft Elm.

Miscellaneous

Coal and Timber

Will purchase in large tracts only, either in Canada or the United States. We are principals and only deal with owners. No agents or options. Address "Cash," c/o Canada Lumberman, Toronto. 4-7

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Vertical Spindles

It is rather remarkable that a great many mills, where everything to enable the greatest amount of work possible to be obtained from the machines is to be found, do not possess a vertical spindle. They will have band-saws, planers, deal frames—the list need not be detailed. It is sufficient to say that the mill is without a vertical spindle. Of course, we do not refer to mills that make joinery, but to the many trade mills that saw and plane for the trade. "Quantity" is the motto in a trade mill, and the small order is looked at with a frown. Yet, in spite of this, there are many occasions when it is absolutely necessary to take orders that do not pay for the machining for the sake of the orders that do. A big planer will be idle for a day while it is being set up to make a large moulding. Perhaps all that is required is two or three of one section. Only those who know can realize how difficult it is to fit up a large planer for some special mouldings, and yet it is a very simple matter to do these same mouldings in one-tenth of the time on a vertical spindle. When this is realized we are sure that those who at present have charge of large mills, which do not possess a vertical planer, will remedy this defect, and will order one. The reason why the vertical

spindle is such a useful machine in a trade mill is that any order that is at all intricate or out of the usual run of work can be executed upon it in such a small space of time. Take some mouldings, for instance, that have to be done on a big planer in a mill where there is no vertical spindle. There are the following adjustments to make: The alteration and setting up of four cutter blocks, the making of shoes to fit the moulding, and the careful adjustment of all the cutter blocks, to get the exact shape and outline. All these adjustments take a great deal of time and considerable care.—Timber News.

Some Second-Growth Prejudices

There is considerable prejudice in New England against whitewood. This is the tree known also as tulip and yellow poplar, but owing to the large amount of sapwood in the second-growth the name whitewood is usually applied. It is claimed by some manufacturers that whitewood is harder to work and causes more trouble from warping and checking than is the case with yellow poplar. As a result the high-grade material is brought in, while the local product is hard to dispose of at a profit. Other manufacturers claim that the prejudice against the wood is not justified and that with proper handling it will fill many of the places of the more expensive poplar. A maker of porch columns uses whitewood and states that it gives excellent satisfaction. Since the future demands for timber must ultimately be met for the most part by second-growth material, a better knowledge of second-growth hardwoods seems desirable. Chestnut is one of the most common trees in southern New England, yet many furniture manufacturers will not use it, preferring stock from farther south and west. While there are apparently grounds for its discrimination, it is quite probable that many of the objections could be overcome by improved methods of cutting, handling and selling.

Can This Waste Be Eliminated?

A resident of Spencerville, Ont., recently sent to the editor of Conservation a sample of curled maple, suitable for fine cabinet work, of which five cords had been delivered to him in the form of firewood. Much of it was split in slabs reaching twenty inches in width, and all of it was of good quality. On previous occasions, the same gentleman has been sold cordwood consisting of large-sized bird's eye maple, wavy birch of fine grain, black cherry and butternut.

A somewhat similar waste of fine woods for inferior purposes was brought to our notice by a manufacturer of vehicles in St. Thomas, Ont., who showed us samples of waste pieces from his factory, of oak, ash, hickory and hard maple. Many of these pieces would be very suitable for tool handles, etc., but, through lack of a market, are obliged to be sold as firewood.

Review of Current Trade Conditions

Ontario

The soft wood trade in Ontario seems to have entered one of the quietest seasons which it has experienced for several years. Prominent wholesalers report that they have not seen so little business in progress at this time of year during the last ten years, one dealer declaring that business is at least 50 per cent. off in volume. The causes seem to be numerous. In fact, the general opinion is that the reason for the quietness is to be found in the co-operation of a number of factors, which, in themselves, would not have been sufficient individually to reduce trade to any noticeable extent. Tight money, severe weather, lack of building activity and uncertainty in regard to such important matters as the situation in connection with the Canadian Northern Railway finances, are among the chief causes. Trade in Western Canada, moreover, does not seem to have picked up to any extent, and, as much of the prosperity of Ontario depends upon the west, the effect is quite noticeable in a smaller demand for such raw material for manufacturing, as lumber.

No one seems to think that the present situation is a matter for serious anxiety. The most frequent opinion heard is that trade may pick up at any moment, as soon as the causes contributing toward greater activity are more pronounced. The representative of a well known southern pine manufacturing company, who recently made one of his regular trips in Ontario states that the large manufacturers, particularly the agricultural implement makers both in Canada and the United States are buying extensively, which may be taken as an encouraging indication of improvement. The International Harvester Company, for instance, according to his report, recently placed an order for 250,000,000 feet of long-leaf yellow pine alone.

The hardwood trade, while not so quiet as other lines, is by no means active. Shortness of money and severe weather seem to have been affecting it to some extent. There is a pretty fair movement of 1 in. 1sts and 2nds birch, and good lines of basswood are moving fairly well. Large consumers of hardwoods are reported to have light stocks. Stocks in the hands of wholesalers and manufacturers are also light. The quantity of hardwood taken out of the woods during the past winter was probably about the same as during previous winters. A number of wholesalers have been devoting their time of late, more to cleaning up their back orders than to looking for new trade. The volume of trade in the case of some hardwood wholesalers has not suffered very much. A few, in fact, report that their sales during the first three months of 1914 have been practically the same as they were during the corresponding period of 1913.

Improvement is reported in business conditions at Ottawa. Several dealers have made fairly good sales within the past week, although prices show no important alterations.

Eastern Canada

Better weather during the month of March helped the lumber trade at St. John, N.B., to some extent. There has not been any real activity, however, in the movement of stocks. Factories have found it difficult to keep their men employed, and have only done so by turning out stock for the summer trade. All the mills at St. John are prepared for their summer sawing and will be in operation by the middle of the present month. Some of the larger mills commenced sawing late in March. No change has occurred in prices during the past fortnight. All the mills have sold their cuts of English deals for 1914, but American stocks have not been sold in advance. City cut deals are quoted at \$17 per thousand for the usual specification. Ends are bringing \$12 and 4ths \$15. Refuse lumber will sell at the mills at about \$11 per thousand. No business is being done for the American market, but an improvement is hoped for when warmer weather has set in definitely. Some city cut laths are selling at \$2.85 on the wharves. Spot laths held over from last fall are quoted at \$3.50 per thousand on the wharves. There are between seven and eight million laths in stock at St. John. Stocks of English deals have practically all been shipped. Stocks of dry pine are scarce and are likely to advance in price this season.

Logging operations in the woods are finished. The outlook for driving is only fair as there is not much ice in the woods and the snow will pass away quickly. Much will depend therefore upon the rains. It is estimated that the cut on the upper St. John will amount only to about 60,000,000 feet. The price of logs is expected to be about \$1 per thousand higher than it was last year.

The New England market shows a firmer tone in spruce, parti-

cularly dimension stock. Several spruce manufacturers who have been selling to the retail trade direct at Boston report their intention of asking \$24.50 as a base price instead of \$24. Some dealers still complain of quiet business, but many others report an improved demand for frames. One sale is reported of 90,000 feet on a \$25 basis. Retailers are apparently realizing that further delay in making their purchases may be expensive. At New York, the prices of spruce continue firm and several large orders have recently been placed at slight price advances. Yards are fairly well stocked with spruce assortments and weather conditions have not encouraged the movement of stock. Although the prospects for any extensive increase in the building demand are slight, retailers are making more enquiries than formerly, indicating a tendency to take advantage of present prices, in anticipation of an early advance.

A firmer market is reported for lath at Boston. Most of the transactions for 1½ in. are at \$4.15 to \$4.20 and even \$4.25 is reported in a few cases where quick delivery was required. Some dealers are asking \$4 for 1½ in., but most of the business is at \$3.75 to \$3.80. Shingles are rather unsettled. A large Canadian manufacturer recently dropped his price for white cedar extras to \$3.55 and for clears to \$3.10. An increasing interest is being taken in British Columbia red cedars, since the removal of the duty, and salesmen report that they can obtain \$3.65 for reds more easily than \$3.55 for white cedar extras. For extras, five butts to 2 in. full count, \$3.75 has been obtained. Clears are ranging from \$3 to \$3.25 and second clears from \$2.75 to \$2.90.

Great Britain

Very little improvement, if any, is reported in the London spot market during the past fortnight. Forward buying is very slack. Deliveries from the London docks, however, continue in fair quantity. For the week ending March 7th, the total was 4,782 standards as compared with 3,045 standards during the corresponding week of 1913. Liner shipments show little or no change. At Churchill & Sim's recent auction sale, 3 x 6 to 9 in. 3rd Quebec spruce, 10 to 13 ft. sold at £10, while 3 x 7, 3rd, 6 to 8 ft. brought £9 5s. Some 3 x 9, 3rd, 6 to 9 ft., brought £9 5s. Prime British Columbia fir sold at £13 5s. per standard hundred for 4/6 x 12/16, 12 to 32 ft. 3rd Quebec pine, 3 x 11 in., 12 to 16 ft. brought £15 5s. Quebec birch planks 2 x 6 to 16 in., 6 to 17 ft. brought 1s. 6½d. per cubic foot.

A little more activity is reported at Liverpool in spruce deals on c.i.f. terms for forward delivery. Offerings of the better classes of deals are not as yet plentiful. Several cargoes are reported to have been placed at prices which should be satisfactory to the shipper. Liner parcels have been coming in steadily and have eased off a little in value, as the market is already overloaded. The spruce spot market is not very buoyant and importers have to take what they can get. The indications are that the import season will be started with as large stocks as have been held for years at a similar period. The present consumptive demand is much below par. Only a few transactions are reported in birch, on c.i.f. terms. Values continue remarkably firm. The spot market is unchanged, and the consumptive demand exceeds the import, so that stocks are being reduced slowly, but surely. At Manchester, parcels of the better cut of spruce deals are offered at £9 15s. basis for 7 and 8 in. x 3 in. for the season's shipment.

United States

An uncertainty still prevails in regard to the general business situation in the United States, but there are some who feel convinced that business is in a sound condition and will show satisfactory improvement within the next month or two. During that time they expect to see the commerce of the country readjusted to meet the new conditions brought about by new laws which have recently been put into force by the government. There are still, however, many obstacles to be overcome, the chief among these being the fact that the railroads persist in remaining out of the market. Until the railroads and other large corporations feel free to purchase more extensively, a general return of trade activity is not expected. In regard to the lumber business, there is a fair amount of buying in progress in most parts of the country, but there is no rush. Every order received bears distinct marks of having been very cautiously considered and yard owners are sorting their depleted stocks, rather than buying extensively. They are, in fact, still playing a waiting game. Building activity is commencing to increase, wherever the weather has relaxed and this would seem to indicate that the movement of lumber will soon become more general. The wood consuming industries are fairly busy, but are very

conservative in their purchases. Taking everything into consideration, the lumber business is upon a basis of purchasing for current requirements only, and shows no speculative feature whatever.

Northern pine, with the arrival of mild weather is showing seasonable signs of activity. Prices remain steady with no indication of advance until the movement becomes much heavier. The lower grades are moving more rapidly than the uppers, but box factories are not buying as extensively as they were a year ago.

Hemlock shows a slight improvement. Northern stocks are small and prices are sufficiently high to permit of some profit, yet not high

enough to prevent active competition with southern pine. Pennsylvania manufacturers are reported to be accumulating stocks at the mills, rather than pushing sales. The eastern demand is still slow.

The hardwood trade appears to be improving gradually, although the demand is still of a hand-to-mouth character. Plain oak is moving fairly well. Ash and hickory are strong and offerings are not heavy. The lower grades of poplar are active. In the north, the trade in hardwoods continues on about the same basis as during the winter, and prices are firm. Maple is strong, especially in inch lumber. There is a steady movement of birch. Elm is moving well at good prices.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Stirring—Details of Log Output

St. John, N.B., March 23; (Special to the Canada Lumberman):—A slight improvement has taken place in the local lumber trade during the last ten days, but previous to this it has been the duller winter in three years. The factories have been hard pushed to keep their men employed, and have only done so by making up stock ahead for summer trade, of which they now have large quantities. The weather has improved much during March and this has caused a certain amount of repair work to be taken up, but the outlook for building for the coming season is not nearly as good as last year. Many large building enterprises were carried out last season and are now about finished; namely, the C. P. R. elevator, the Atlantic Sugar Refineries, the Armory, the McClary Company warehouse and offices, the Bank of British North America, the Merchants Bank of Canada, and many dwelling houses. No great buildings such as the above will be undertaken this year. Of course, a certain amount of changing over of buildings is always going on. The C. P. R. will change over the Vassil building on King street to offices for themselves, and then they will have their entire offices under one building, not scattered as they are at present. It is said that the Fenton Land Company will build about twenty dwelling houses this year. The New Brunswick Realty Company will build two or more dwellings besides some other projected houses for which plans are now being made.

All the mills are being prepared for summer sawing and will all be in operation by April 15th. Messrs. Stetson Cutler & Company will start their Pleasant Point mill on March 28th, as will Messrs. Randolph & Baker; Stetson Cutler & Company sawing for the American market and Randolph & Baker for the English market. During the past winter, Stetson Cutler & Company have built a new distributing system at their Pleasant Point mill. This is to make the work much easier. It will now take less men than before to handle the deals, etc., in the yard. J. E. Moore has made some extensive improvements in his new mill at South Bay. All the other mills have had more or less improvements put upon them. It is not known whether the Hilyard mill will be in operation this summer, or not, as it is said to have been sold to a company of real estate men, called the Harbour Properties Limited. This mill has been sawing for Messrs. Stetson Cutler & Company during the past two years.

English Deal Cuts Sold

Prices of wood goods remain about the same as at last writing. All the mills here have sold their cut of English deals for the coming season. The American mills have not sold ahead. The price for deals is largely for city cut \$17 per M. for the usual specification, viz., 50 per cent. 7 and up x 3 in., 50 per cent. 9 in. and up, with 3 x 4 and 5 in. at \$15; 3 x 6 in. \$15.50, 7 x 2½ in. at \$16 to \$16.50, ends \$12, fourths \$15, side boards have been sold at around \$16 per M. for the ordinary merchantable quality, clears included. Refuse lumber will be sold from the mills at about \$11 per M. for all kinds.

The American market is extremely dull at present. Practically no business is being done from this port. Reports show that very little work has been carried on during the past winter, but should warmer weather set in, an improvement is likely to take place, although the buyers seem very dilatory about purchasing any stocks ahead. Laths have been sold, for some city cuts, at about \$2.85 on wharves. Other mills prefer to wait until later. Mills having spot laths held from last fall, are asking \$3.50 per M. on their wharves. Seven to eight million would be a fair estimate of stocks of lath here, about all the deals, boards, etc., have been shipped from the English mills. Messrs. Stetson Cutler & Company have quite a stock of American sizes at their different mills, probably in the vicinity of eight millions of two, three and four inch. Stocks of pine are scarce, es-

pecially dry lumber, and will probably see higher prices during the coming season.

Operators Waiting for the Drive

Along the river, about all the logs have been hauled to landings and operators are now waiting for the streams and rivers to break, when the logs can be driven, rafted and delivered to the mills. The outlook for driving at the present time is only fair. While there is quite a quantity of snow in the woods, there is very little ice under it, and when the snow is gone there is nothing left to fall back on. Conditions, therefore, will depend entirely on the rains. It is rather early to predict what the driving will be on the lower section of the river. The cut of logs, such as bark logs, has been fair.

	Feet
On the Neripis, H. W. Woods will have about	700,000
J. E. Moore on the Oromocto and lower part of river	3,500,000
King Lumber Co. for St. John (J. E. Moore)	300,000
Sayre Co. on Salmon River and lower part of St. John	3,000,000
Warner & Co. on the lower river	4,000,000
J. A. Gregory, hemlock, on the Oromocto	1,000,000
Little River Sunbury Co., for the River Valley Lumber Co.	3,000,000
For the Partington Pulp Co. Estate	1,000,000
Partington Pulp Co. on the Nashwash for St. John old and new about	21,000,000
Sundry operations by farmers	3,000,000
All the above logs will come in below Fredericton and will go practically all to St. John.	

Above Fredericton the Fraser Lumber Company will probably have the larger quantity of the bark logs for their mill at Fredericton.

Reduced Cut on Upper St. John

A rough estimate of logs for St. John mills from the Upper St. John, would be:

	Feet
Chouinard & Kilburn for Murray & Gregory	9,000,000
Nobles-Currier-Cunliffe Bros. for Stetson Cutler & Co.	17,000,000
Randolph & Baker on Little, Black, Green and Grand rivers.	12,000,000
J. E. Moore and Charles Miller on Salmon River	8,000,000
Stetson Cutler & Company on Tobique	6,000,000
Chas. Miller on Tobique	4,000,000
Other operators	4,000,000

Total, about 60,000,000

This is a very small cut and is caused largely by the quantity of logs held over in St. John after the strike of last year.

The prices for logs will be about a dollar per thousand higher than last season.

Labor is quite plentiful at present, and no clouds are in the sky regarding strikes, etc. Wages will remain the same as in 1913.

Montreal Outlook Fairly Good

Montreal, March 24th (Special to the Canada Lumberman): Although here and there dealers report a quiet trade, business generally is stated to be fairly good. Some wholesalers have booked many substantial orders, prices being firm with an upward tendency. The outlook is distinctly satisfactory, for while the large structures to be erected are limited, there is certain to be a heavy programme so far as residences are concerned.

There are complaints of drastic cutting in local quotations, a condition which is not expected to continue, and is probably due to exceptional circumstances.

Dry stock is scarce, and will become more difficult to secure as the season advances.

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

MILLS AT

Sayabec, Que. Cedar Hall, Que.
Salmon Lake, Que. St. Moise, Que.
Jacquet River, N. B.

WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA

Sash and door factories are, for the most part, well supplied with orders.

The position of the ground wood market has not altered. It is likely to continue until the spring is well on, when there will be plenty of water power available. It is expected that the demand will increase, although no gain in price is likely.

Chemical pulp mills are shipping out their products at a good rate. Recently there has been a more active trade and prices are hardening.

News print mills are very busy, and shipping their entire output.

Barbados Market Report

S. P. Musson Son & Company, Barbados, B.W.I., report under date of February 27th as follows:—Lumberstuffs.—White pine.—The only arrival during the fortnight is the Schr. "Moran" from Lunenburg, to selves, with 110 M. ft. which we had sold to arrive at \$32 for merchantable, \$24 for second quality, and \$18 for inferior. Market is fully supplied, and we do not look for any improvement on last prices at present. Spruce.—The only receipt is a small lot of 15 M. ft. ex "Moran" chiefly second quality and refuse, which we sold at \$22, for second quality and \$18 for inferior. Dealers have sufficient stock on hand for present requirements. Pitch pine.—No receipts, but a cargo is expected. Shingles.—No receipts of either Long Gaspe or cedar laying, and there is a slight enquiry for both descriptions. We could recommend a shipment of best quality Long Gaspe, but there is no demand for inferior grades. Shooks.—No arrivals. Wood hoops.—Receipts consist of 734 bbls. by the S.S. "Savan" imported on dealers' account.

Ottawa Trade More Active

Ottawa, March 23rd (Special to the Canada Lumberman): With the long winter over, business is showing signs of improvement. Several of the dealers in Ottawa and district report some fairly good sales within the last few weeks. There have been comparatively no alterations in prices lately. Pine s.c. strips 1 in. have advanced from \$20 and \$22 to \$21 and \$23.

Mr. Hugh M. Williams, of the Williams Lumber Company, returned home last week after a two months' visit to Great Britain. Trade there, he says, is far from brisk, the lumber business particularly being anything but encouraging just now. However, with the settling of some of the big problems now before the country, merchants in general feel confident that things will improve rapidly. "One phase of the lumber trade, which I think is proving detrimental" said Mr. Williams, "is that some firms are shipping on consignment and selling at any prices offered in preference to holding back for awhile. It is in this way that trade and prices are being demoralized. I know of cases where Canadian lumber was sold in Great Britain cheaper than it could be bought at the mill's here. I found that English dealers are very prone to substitute almost anything for Canadian white pine. Manufacturers here should do all in their power to discourage this."

Ottawa Valley Protective Association Formed

With the object of forming a Forest Protective Association some of the leading lumbermen of the Dominion met in the Chateau Laurier last Friday to discuss plans for organization. Hitherto the business of protecting the forests has been carried on for the most part by the individual owners of forests, but, profiting by the example set by collective timber limit owners in British Columbia and Quebec, the lumbermen in the Ottawa Valley and other districts deemed it wise to co-operate. Senator W. C. Edwards occupied the chair at Friday's meeting and the committee named to organize the association is composed of Senator Edwards, Ottawa; George H. Millen, E. B. Eddy Company, Hull; J. B. White, Riordan Pulp and Paper Company, Hawkesbury; R. M. Kenny, James MacLaren Lumber Company, Buckingham, P.Q.; and W. C. Hughson, Gilmour and Hughson, Hull, P.Q.

The meeting was largely attended by some of the best known men in the lumber trade and forest protection work. Among the firms and their representatives present were Messrs. George H. Millen and J. F. Rochester, E. B. Eddy Company; Senator Edwards, Gordon C. Edwards and J. A. Cameron, of W. C. Edwards and Company; P. C. Walker, Shepherd and Morse Lumber Company; Sir Henry K. Egan, Hawkesbury Lumber Company; J. C. Brown, Fraser and Company, Ottawa; J. H. Black, of J. R. Booth and Company; Grant P. Davidson and James Davey, Estate of Jas. Davidson; W. C. Hughson and A. E. Maxwell, Gilmour and Hughson; R. M. Kenny, E. J. Graham and J. E. Rothery, of James MacLaren and Company, Buckingham; J. B. White; Charles Read and John Gwynne, Riordan Pulp and Paper Company; Clyde Levitt, Dominion forester, commission and conservation, and Arthur H. Graham, government forest agent, Arundel, Que.

It is proposed that the new association appoint a manager under whom will be four inspectors, who, in turn will have under them a number of forest rangers. Each inspector will have a separate dis-

trict under his control. Lookouts and telephones will be placed on the mountains and these, with the aid of modern telephone equipment, will help to prevent the spread of fires. All the railroad lines through the forests will also be patrolled. The work of the association will be practically the same as that now being carried on by the St. Maurice Forest Protective Association.

Mr. St. L. Decarteret, president of the St. Maurice Association, and Mr. J. B. White, of the Riordan Pulp and Paper Company, gave an outline of the work accomplished in Quebec and spoke of the advantages which had been derived from the St. Maurice association. Mr. J. Price, consulting forester of British Columbia, spoke strongly in favor of forming an association and demonstrated from experience the benefits to be gained.

St. John Shipments to Transatlantic Ports

The export of lumber from St. John, N.B., to transatlantic ports in January and February was only about half as great as for the corresponding two months in 1913. The figures follow:

	1913.	1914.
Spruce, sup. ft.	16,212,005	8,065,382
Hardwood, sup. ft.	453,481	1,327,804

With the exception of 501,387 superficial feet of spruce to South Africa and 110,000 feet to Australia, the shipments went to Liverpool, Manchester, Irish ports, London and Glasgow.

Shipments for January and February this year were as follows:

	Spruce S. Ft.	Hardwoods S. Ft.
W. Malcolm MacKay	4,107,928	201,299
John E. Moore & Company	1,590,127	180,583
George McKean	1,264,296	627,629
Other Shippers	1,103,031	318,293

Comparing shipments for February alone the quantity of spruce was 3,377,779 feet compared with 7,993,672 for February of last year. Shipments for March are also likely to show a marked reduction compared with the corresponding month last year.

Liverpool Market Report

Alfred Dobell & Company, Liverpool, Eng., in their monthly timber market report, under date of March 6th, write as follows:—The market presented no special feature during the past month. Supplies again came forward moderately and a slightly improved demand prevailed at generally steady values.

Canadian woods—Waney board and square pine.—The demand was of a retail character. Oak.—A fair consumption prevailed at firm prices. Rock elm.—A slightly improved demand existed. Birch.—Logs.—The arrivals, which were light, have been on contract. There was a steady consumption at firm figures. Planks.—Although the stock shows some diminution, it is still on the heavy side. Pine deals and boards.—There was only a moderate demand and supplies are ample. New Brunswick and Nova Scotia spruce deals.—Although the consumption exceeded the import by nearly 3,000 stds., the stock is too heavy for this period of the year.

Wholesale prices of Colonial woods, at Liverpool, are as follows:—

TIMBER	£	s	d	£	s	d
Quebec square white pine, per cu. ft.	0	2	6	0	4	0
Quebec waney board pine	0	3	4	0	5	0
St. John pine, 18 in. average	0	2	6	0	3	9
Quebec red pine	0	2	6	0	3	0

An Attractive Calendar

A very attractive calendar for the year 1914 has been sent out by James D. Lacey & Company, Timber Land Factors, 1750 McCormick Building, Chicago, Ill. The calendar is handsomely designed and is decorated with a striking colored picture reproduced from a photograph taken in the Deschutes Valley, Central Oregon, showing west-

Canada's Largest Saw Mill

Douglas Fir Timber

We manufacture and ship on short notice all sizes and lengths of merchantable timber up to 120 feet in length for derricks, scows, dredges, shipbuilding, bridge and structural timber. We dress timber up to 24 x 30.

Dressed and Matched Lumber

Write us for prices on rough or dressed clear fir and

cedar. We make quick shipment of clear fir flooring, siding, ceiling, shiplap and boards, also red cedar bevel siding.

Douglas Fir Cross Arms

Douglas fir base casing and mouldings manufactured to standard patterns at close prices, shipped with doors or cedar shingles.

British Columbia Red Cedar Shingles

We make our own shingles and place our brand on them, which is our guarantee that they are manufactured fully up to grade with regard to quality of material, sawn to full thickness and tightly packed.

We want your permanent trade. Let us ship you one car.

B. C. Fir Doors Are Perfect Doors

We are now making 1000 perfect fir doors each day and can double this output on short notice. Our door sales are increasing rapidly and the reason is that we are making a perfect door with regard to quality of material and workmanship. Prices and information furnished on request.

Three ply rotary cut fir veneer makes beautiful panelling.

Canada's Largest Door Plant

ern yellow pine which predominates in that territory. The timber is very large and of splendid quality and the picture is sure to be given a prominent place in any lumberman's office who is fortunate enough to receive a copy.

Quiet Trade at Liverpool

Farnworth and Jardine in their wood circular, under date of Liverpool, Eng., March 2nd, say:—The business of the past month has again been of a quiet character, but as arrivals generally were moderate, deliveries more than kept pace, thus making some impression on stocks, but several of the important lines are still too heavy. Values for some of the leading articles are difficult to maintain, otherwise prices are fairly steady. The freight market is dull, but some deal charters from Canadian ports have been concluded at moderate rates.

Canadian Woods.—Pine timber.—There is little change in the position to report. The demand continues quiet, and values rule high, but stocks available are fairly moderate. Waney pine, 1st class.—There has been very little enquiry during the past month. The deliveries have been small, but stocks in first hands are light. There is little change in values to report. 2nd class is only in limited request, and present stocks are sufficient. Red pine.—No change. Oak.—No arrivals; demand is restricted, and the deliveries have been disappointing, but stocks are moderate and values steady. Elm moves slowly, but prices are firm, and stocks moderate. Contracting for fresh supplies has been on a slightly higher basis. Pine deals.—Imports nominal; there has been rather more enquiry, and the deliveries show improvement, but stocks are ample. Values are unchanged. Red pine deals.—Demand inactive.

New Brunswick and Nova Scotia spruce and pine deals.—Imports to the Mersey (including Manchester) amounted to 2,570 stds., against 3,260 stds. for the corresponding month last year, about equally divided between Liverpool and Manchester. The deliveries have been fairly satisfactory, but stocks, though further reduced, are still too heavy. Sales have been confined chiefly to liner shipments, and values difficult to maintain. Contracting for next season's supplies is not active. Pine deals.—The demand is limited; prices firm.

Birch.—Logs.—The import has been nominal; more enquiry for fresh wood, and stocks are low. Values are firmer. Planks again arrived in moderate quantities. The deliveries have been fair, and stocks are in a moderate compass, but there is little change in values to report.

British Columbian and Oregon pine.—The import amounted to 4,000 feet. The demand is quiet, deliveries small, and stocks are heavy.

London Stocks of Colonial Timber

Churchill & Sim, in their wood circular under date of London, Eng., March 4th, report the stock of Colonial timber, deals, etc., at the public docks on March 1st as follows:—

Pine deals and battens in Pieces	535,000	433,000	374,000	496,000
Red pine	20,000	22,000	47,000	66,000
Spruce ditto	803,000	492,000	553,000	541,000
Oak timberin Loads	—	—	32	34
Oak planks, etc. (American)	4,287	1,298	2,451	1,392
Birch timber	271	183	218	146
Birch planks	5,474	4,904	3,989	2,676
Ash timber	55	12	—	—
Elm timber	1,445	232	615	878
Yellow pine timber	946	810	318	228

Importations during the month from New Brunswick were as follows:—

Pine deals . . . 3,000 pieces	against	72,000 pieces in 1913.
Birch planks . . 38,000 pieces	against	33,000 pieces in 1913.
Spruce deals . . 50,000 pieces	against	Nil pieces in 1913.

The demand for pine deals has been small again in February, but there is no alteration in prices. Spruce have been more freely sold at some concessions in market rates, and the stock is still too heavy in the face of a quiet trade.

The stock of B. C. and Oregon pine has been increased by the arrival of a sailing cargo of timber; prices ahead have fallen in sympathy with reduced tonnage quotations, but this has not yet had an effect on the prices for long logs, but shorter specifications have fallen in value.

The Care of Extra Thin Band Saws

By Hapsburg Liebe

With timber growing scarcer and scarcer every day, and the prices of lumber going higher and higher correspondingly, the motif of the future is going to be thinner saws—perhaps I should have said more thin saws. Now, personally I have never liked extra thin saws, but that fact is not going to keep me from telling the truth about the

future. As I started out to say, the excellent filer of to-morrow is going to be the expert on extra thin saws.

Thin blades are relatively harder than thick to make go right. This is a great reason: As much clearance on either side of the plate is required for the one as for the other; the thin saw must cut more wood for its thickness, and therefore its strength, than the thick saw. Figure it out as minutely as you please for yourself; I think you'll find it interesting. But the thin blade has one thing in its favor, although this cannot make up for the foregoing feature not in its favor; owing to its readily conforming to the circumference of the wheel, it is not so apt to crack as its bigger brother.

Now in caring for the delicate fellows, one must be sure that everything is as it should be. The swage anvil must be perfectly square, and it must set on the back of the points correctly, or the points will be bent out to one side. Owing to the width of spread required in comparison with the thickness—or the thinness?—of the plate, the swaging should be barely sufficient or the point may split; and if it doesn't split, the over-working of the steel with the shaper in the work of getting the spread down to the necessary littleness will cause the point to crumble away. If the steel is hard enough to hold a cutting edge, and to hold tension satisfactory, it will crumble when it is over-worked. This latter is a common complaint with some young filers I know; and in this connection I will mention that I have seen more than one good saw returned to its makers unfairly.

A not unusual devilment in the practice of fitting thin blades comes with the automatic sharpener. If it does not face up and back up the teeth squarely, the good effect of the squareness of one's swage will be lost. If the emery wheel blues or case-hardens the points, they will crumble away and give trouble; and for this evil a nicely-running machine and an emery wheel of the right kind, kept faithfully dressed with a dresser, is the remedy. If the teeth are bent, ever so slightly, the grinder, though set squarely, will not do its work right. Bent teeth should be leveled going through the grinder and not afterward.

In hammering, the same patient care that is observed elsewhere should be observed even more. The hammer that fills the bill on the big saws will not always fill the bill on the delicate ones. A light hammer is best, one with a long, flat-oval face. Especial care should be given to the roots of the teeth, and one should not be misled into hammering too much or too little by the light that shows in the gullets. The leveling-block should be surfaced as frequently as it shows rounding on the edge over which the teeth are worked.

In rolling the thin saw, the roll line that will barely affect the thicker blade will often cause the little fellow to fly open almost from one edge to the other. One should move carefully here, indeed. The rolling should be very lightly done, and well distributed over the tight surfaces. Of course the rolls should not dish the plate; however, even with the most perfectly ground rolls, dishing will occur if the saw is held too high by the operator, or if it passes out at too sharp a downward or upward angle. It is an act of wisdom to apply the straight-edge upon the freshly-rolled surface, just to make sure.

Here is a little handicap in the thinner blade that is worth the mentioning: The relative amount of tension being the same, the thin saw will not flatten out on the leveling-block so readily as the thicker saw. The very best thin-saw filers I have known carried as much tension as they could level perfectly, using a weight on either end of the section being treated by the hammer. To go beyond that amount of tension, of course, would be to defeat one's purpose for the surplus metal of the central parts would bulge out into lumps, even if the plate could be leveled at the outset.

As to crown, one should be governed by the machine on which his saws are to be run. This I regard of great importance, and I gleaned the idea from experience. The degree of crown that suits a short saw running on wheels close together, is not the best degree of crown for a long saw on a machine with wheels far apart. A little experimenting is necessary, of course. Taking for granted the wheels are in line, with true faces, pull the crown out until the saw begins to flutter on the back; this is not an absolutely safe rule, but it will do as a rule to begin one's little experimenting on. On machines in good order, the correct amount of crown will run from 1-64-inch in 6-feet to 1-32-inch in 5-feet.

I did not leave the machine itself until the last because I regarded it of the least importance. If the best machine on earth is wrong in its adjustments, the best saw on earth won't run well on it. Too often a hand resawing machine is given a lining-up of its two principle shafts, and then expected to work miracles. Even if the two principle shafts and their respective wheels are in perfect level and line and well-fitted in their bearings, if the guide as it moves up and down is not in line with the saw there's trouble. And, even more important, if the rolls do not feed the stock squarely against the saw there's trouble. I have seen a few filers pull themselves out of a hole, and a bad hole, by putting the rolls and the guide where they belonged. To sum up, everything must be in favor of the extra thin saw if it is to hold its fitter his job.—Berlin Quality.

Broom Handle Manufacture in Sawmills

A prominent manufacturer of broom handles was recently pressed for his opinion as to the advisability of sawmill operators engaging in the manufacture of broom handles as a side line. Speaking of this phase of the question the gentleman said:

"I don't want to discourage any one from entering into the manufacture of broom handles (although I think there are already enough handle factories in operation) but I would like to impress on those contemplating entering this line to investigate it carefully beforehand, figuring out exactly the product from a thousand feet of lumber, the cost of manufacturing it, and various other information necessary. As a rule figures based merely on the general run of information will show that there is a big profit available in the manufacture of broom handles, but a different conditions is shown on actual investigation of operations in some well regulated handle factories. For instance, every 5,000 feet of lumber sawed up through all the processes up to the time the handles are bundled into grades, will show that there is a great difference between actual facts and theoretical figures. There is a great variation in the way lumber will cut up, and there is also a variation in the rate of capacity of lathe. It will be found that the very best grade of maple lumber is necessary to make high-grade handles, and that high-grade lines are the ones that show the profit. Handles of inferior quality seldom bring enough to pay for the lumber. There will also be edgings from the rip saw, cull handles in the blanks and also finished that are not worth the value of the timber used. Of course it would be foolish to state that there is no money in the broom handle business, for if this were true very few people would be in it. There is a good profit in this line for concerns that know well how to buy their lumber, how to work it properly and grade it correctly, and further are familiar with the best methods of marketing their output. A reputation for specific knowledge of the handle business is a strong asset to the broom handle manufacturer.

"A sawmill concern of good standing manufacturing considerable maple, say from 5,000 feet up a day, ought to be able to make broom handles at a profit if it starts out in the right manner and is willing to learn by experience. Much difficulty is encountered in the actual manufacture of the handle, as it seems that the handle lathe is one of the hardest to operate. An inexperienced man can never be placed in charge of one of these machines, for as soon as this happens trouble will result. As long as a lathe is in perfect order any one can start it and can even grind and sharpen the knives, but when the knives are out of the correct shape or the heads are out of center, it is time to call in the experienced man. In fact experienced handlers of these lathes occasionally get into trouble and have to send to the factory for assistance in their adjustment.

"A sawmill man contemplating entering the handle business should first secure the services of an experienced broom handle manufacturer, one who is intimately acquainted with the best methods of manufacture; who knows all about handle lathes and the grading of handles, and who is also fairly familiar with market prices. A great deal of agitation in the market for broom handles is caused by small mills who make this business a side line, and who simply turn out the handles on any basis and market them without any definite idea of their actual value. The reason for the price cutting, of course, is that they do not know what it costs them to make a thousand handles. They feel that inasmuch as they are supplying the material themselves, it is an inexpensive item, whereas they should consider the cost to themselves exactly what it would cost any other manufacturer to sell it. At the end of the year they apparently figure a profit on this basis and are satisfied. Inexperienced men militate against the quality of the handles and result in a great production of low-grade

stock. It is necessary for every factory to turn out a certain percentage of low-grade handles—in fact this percentage often runs larger than is desirable—but the experienced handle manufacturer is constantly trying to cut down his percentage, and to get the price on these handles to a point where he can realize at least the value of the lumber contained in them. This effort is rendered particularly hard because of the fact that so many low-grade handles are being constantly put on the market.

"If the firms making broom handles as a side line would keep a close account on them for a month all through the factory, charging every legitimate charge against them as they would in any other line of a well regulated business, and would also keep a close account of the percentage of each grade when ready for the market, it is a safe conclusion that the handle market could be materially strengthened. If it is found that the handles are not of sufficient quality to bring the right price, then the remedy is to secure the services of some one who will show the firm how to manufacture."

"Handle manufacturers report that there should be a brisk demand for basswood lumber at this time of the year as the handle men usually lay in a supply of this wood to manufacture ceiling handles for winter and spring delivery. Basswood is well suited for this purpose on account of its light weight and the ease with which it is worked, also its ability to stay straight. However, unless it is well dried it will not go through the lathes. For this reason the handle men usually buy it early and dry it themselves.

"It would seem that the big sawmill firms are disposing of all their maple lumber for flooring stock and other lines, as it is very difficult for handle men to buy it at any price. As a consequence the handle man has to get his supply entirely from the smaller mills scattered all over the country, and while the price is usually less, the quality is decidedly inferior. In a great many cases these small mills ship stock which cannot be used. In some instances other wood, such as oak, chestnut, poplar and sycamore, is loaded with the maple. Of course this is an absolute loss to the handle man. In other instances valuable and more easily marketable woods, such as cherry and bird's-eye maple, are mixed with the ordinary handle stock.

"The demand for broom handles has been fairly consistent right along, where as in former years there was no trade at all during June, July and a part of August. While the business as a whole has been rather dull, still this unusual summer demand has brought up the aggregate volume considerably."—Hardwood Record.

R. G. Fletcher, secretary and treasurer of the Canadian North American Lumber Company, Limited, of Winnipeg, Man., is making a business trip in Ontario. The company is a wholesaling concern handling Pacific coast, mountain and north Saskatchewan products. Mr. Fletcher reports that the company is shipping considerable lumber into the States, the new tariff having opened a field not enjoyed by it before. The Saskatchewan product goes to Chicago in the shape of No. 2 lath strips for crating, etc. The business situation in the Prairie Provinces looks better, Mr. Fletcher said. The money stringency, he thinks, was a good thing and the people are now getting down to a sound business basis.

The Maple Dish Association, and organization of Manufacturers of Maple Dishes, formerly known as wire-end butter dishes, has been formed, with offices in Suite 44-45 Produce Exchange, Toledo, Ohio. The object is to secure greater publicity for the Maple dish. Points which will be emphasized in the publicity campaign will be the lightness, durability and sanitary features of the maple dish. All these dishes are cut from sugar maple timber.

The Spirit of Service in Retailing Lumber

By H. R. Isherwood*

The use of the word service as a concrete term to express a variety of trade acts and practices or as a feature of a business policy is comparatively recent. I think you are all familiar with the common meaning of the term service as applied in retail circles especially. Nevertheless I wish to ask your indulgence for a few moments to tell you a few things that I have learned about service and how I think it should be applied to our line of business.

It is not hard to believe that service as the basis of trade has existed since some wild ancestor traded in stone clubs and bearskins and provided free rocks for waiting customers in the most comfortable part of his cave.

Making customers comfortable is perhaps the earliest form of trade service. Until recent times its best example is perhaps shown by the spirit which prompted the old time tavern keeper to display the sign "Rest and Refreshment for Man and Beast." Hotel and restaurant keepers perhaps render more service than those engaged in other lines of business; but between their service and that which we wish to consider there is the difference that patrons of public places not only expect service but also have been educated to pay in proportion to the service rendered. The retail merchant can not charge for service in this open or, at least, understood manner, as service is most effective when least expected. The fact remains that service as a means of getting new trade and holding old customers in the face of competition is a recognized factor today.

The modern philosopher says that the man who never does any more than he gets paid for never gets paid for any more than he does. This is true not only of wage earners but it is true of those involved in every transaction. It is true of the dealings between the merchant and his customers.

Giving More Than Is Paid For

That something represented by "more than he gets paid for" is service. In the individual, it may take the form of loyalty or that habit of helpfulness which makes him single-minded in the interest of his employer. The merchant whose dealings with his customers cause them to say "I always like to trade at So-and-So's" is rendering the service that is bound to be profitable to him.

Here we touch upon the secret service. Service must be born of the spirit. Service, while best expressed in outward acts, needs the confidence and power of spirit, or else service is as impossible as perpetual motion.

When we conceived the idea of adding a service department to our business the things possible to do, to render and to give, seemed unlimited in number. Long before we conceived the idea of service as we are rendering it to-day we were making it a point to assist our customers and prospective builders in many ways. As they inquired for our prices on the different building materials we would question them in many ways. First we would inquire what they wanted to use this material for. Upon being informed for what purpose they contemplated using the material, either the erecting of a house or barn, we found that in nearly every instance our customer had only a hazy idea of the improvements contemplated. While we quoted prices upon the material inquired for, we made it a point to explain to them the advantage of having a sketch or plan of contemplated improvements, so that a list of material could be made up specifying the different kinds and grades to be used in construction; thereby getting their ideas into a definite plan.

Having in our office books of plans of buildings for city and farm use, we would offer these to our prospective customers, and we gave them such other assistance as we could to help them decide upon the plans of their future improvements and their construction. When the list of material was made up and presented to us we took personal interest and pride in discussing the different grades and kinds of materials, specifying the items on the list which would best meet each particular purpose. We learned not only that the assistance which we were rendering our customers was enabling them to erect more modern buildings in specifying the right material for the right place, but that the cost of the material was reduced by our aid in assisting them in the selection, without affecting our margin; and we learned of instances where our service had actually saved our customers a hundred dollars or more upon a single building, without any expense to us other than the time given in rendering the service. We soon learned that our customers were appreciating the service which we were rendering in many ways, and this is how we got the idea of adding a service department to our business.

Obstacles Easily Overcome

All of you who are rendering service, I am sure, have had similar experiences, and all of you, undoubtedly, have discovered the fact that the actually working out was simpler than it seemed in the beginning.

Long before our service department took concrete form we were,

to the best of our ability at least, and with the best of intentions rendering a service with every sale. To make this spirit practical was our task. The first step was to give it a name: "Sawyer Service" was adopted and from the start the name became a live topic with us and our patrons. Our next step was to arrange a room exclusively for our Service Department. The room that we set aside for the purpose is 12 x 20 feet in size. We finished the room up very attractively and tastily with book and sample cases, plan racks, drawing table, chairs, etc. Our next step was to gather up the odds and ends of practical service, with pieces of advice relative to building material and lumber in a concrete and practical form, such as plan books and books pertaining to the different kinds of materials used in the construction of buildings; magazines, blue prints, samples of building materials and booklets describing such materials as are furnished by the manufacturers; in fact, information pertaining to nearly every type and class of construction and material. Thus our spirit of Sawyer Service became more real and all of it made the rendering of such service easier.

Our next step was to advertise the Sawyer Service Department. We did this through the columns of our local papers, using quarters, halves and full-page advertisements, as well as road signs; and I want to say that we are more than pleased with the way our Sawyer Service Department idea has taken root with our patrons. We have just completed a four-page folder covering our Service Department.

"Helping others to help themselves" is one of our greatest pleasures. The plans and books on buildings and construction for any private individual to buy are far too expensive, for after he has completed his building the books would be of no further use to him. With us and our Service Department, however, not only one patron but a hundred or a thousand can use them, and in this way we have found our Service idea a big help to everybody.

Sawyer Service was established for the good of our customers. We believed then as we believe now, that whether a man buys his materials from us or not, if he makes use of Sawyer Service he is going to build better than he could without it and sooner or later we are going to get some credit for it, and that credit will show on our books in the shape of future sales. In the meantime we have rendered service, not only to that patron but to the whole community, in helping to build better than could be done without Sawyer Service, and in no instance are we losing sight of the fact that in making our Service Department a success we must deliver goods of quality and make prompt deliveries.

Service is Self Help

We have not only found our Service Department of benefit to our customers, but we have found it an educational feature in our own business. By setting aside this room and supplying it with the books and other matter pertaining to buildings and materials we have formed a ready reference library for our own use and for use in discussing ideas with our customers, helping them to decide in advance what is best for their particular needs and giving such information as relative values of the different materials, the quantities they will need, the cost, etc. In doing these things we are gaining better knowledge in every instance regarding the materials that enter into the construction of buildings. Even though a man never has been a patron of this company we extend to him the same courtesy.

Other Information Disseminated

We also have in our Service Department such bulletins as are issued by the State university pertaining to the different products grown in our section and these are free to the farmers. We are always ready to give any information that we possibly can to them, and if they desire any information not at hand we take upon ourselves the duty of getting it for them.

What we have done any of you can do. Every merchant is more or less a specialist in his particular line, and to be a specialist in any line is to know more of that line than the man who is otherwise engaged.

The dealer who takes the trouble to give information to his customers freely and gladly, without making them feel that they are placed under obligation, is rendering helpful service, service that is not only appreciated by his customers, but that means increased trade and profits.

Co-operation is one of the great economic forces. Service is the vital element of co-operation. We get what we give.

Rarely, if ever, do we find a man suffering alone from his wrongful act. Every wrongful act must bring suffering in some form, and so it is in this matter of service. The man who does not render service to his neighbor and community, to which, in a greater or less degree he must look for his very existence, is holding back many others in addition to himself.

Mr. Alexander McMillan, Vancouver, B.C., construction engineer for the British Columbia Mills Timber & Trading Company, died recently after a brief illness.

LET US FIGURE FOR A FEW MINUTES:—

We cut annually about M. feet of 4-in. common strips, average price per M. \$....., which totals..... \$——
8-in. and 10-in. shiplap brings \$..... per M. If all 4-in. strips were worked into 8-in. and 10-in. shiplap we would receive \$——

GROSS PROFIT ... \$——

COST OF JOINTING ON A LINDERMAN DOVETAILER 75c per.....
M.; cost of matching and handling, 50c per M. M. feet at
\$1.25 per M. \$——

NET PROFIT \$——

BESIDES, we cut M. feet of 4-in., 6-in. and 8-in., No. 3 grade lumber for which we receive \$....., but for our 10-in., 12-in., 14-in. and 16-in. No. 3 Grades we average \$..... per M. If all were made wide we would receive \$.....; cost of joining and handling \$1.00 per M. \$.....

NET INCREASED PROFIT.. \$——

BESIDES, if we had a LINDERMAN we could cut 2-in., 2½-in., 3-in. and 3½-in. strips instead of leaving them in the slab. We should get about M. feet. In the slab they are worth about \$..... In lumber they are worth about \$..... It will cost about \$1.25 to join and handle \$.....

NET PROFIT ABOUT \$——

BESIDES, we could work all our shorts into full 16-ft. lengths; make grain doors and save 10 per cent. of edging waste, work in our short shorts, besides using the machines for other purposes.

What say you Superintendent?

SHALL WE WRITE THE LINDERMAN PEOPLE AND INVESTIGATE?
It looks as though we are losing money. Let us send this information to the

Canadian Linderman Co. Limited

MUSKEGON, Mich.

Works at

WOODSTOCK, Ont.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

John Piggott & Sons, Windsor, Ont., recently suffered a small loss by fire at their planing mill. The loss was covered by insurance.

E. C. Lawrence, Devine street, Sarnia, Ont., is considering the erection of a planing mill at a cost of \$12,000. He will be in the market for machinery, engine, boiler, etc.

Messrs. D. Gordon and A. W. Thornton have purchased the lumber business of McNairnie Bros., Wallaceburg, Ont., A few weeks ago they also bought out A. Wickens, dealer in lumber.

The Toronto Lumber Company, 432 Logan Avenue, Toronto, have awarded a contract for the erection of a planing mill at a cost of \$2,000, the general manager being Geo. Jordon, 432 Logan Ave.

The John Goodison Implement Works, at Sarnia, Ont., recently suffered a serious loss by fire, in addition to part of its plant and stock of agricultural implements, the company lost a large quantity of lumber which was piled in its yards.

A report has recently been circulated to the effect that the Standard Chemical Iron & Lumber Company of Toronto intend to erect a sawmill at Eganville, Ont. The company advise us that they have never had any intention of doing so.

The mill at Wiarton, Ont., formerly owned by Mr. E. M. Miers, and which was recently purchased by Chas. Pedwell, of Lions Head, will continue to be operated at Wiarton. Mr. Pedwell reports that he has no intention of rebuilding at Lions Head.

The Riordon Pulp & Paper Company have awarded a contract to W. J. Trimble, 152 Bay Street, Toronto, for an addition to their pulp mill at Merriton, Ont., at a cost of \$60,000. The building will be three storeys, of stone construction and stone foundation, with electric lighting, steam heating and pine floors.

The planing mill belonging to the R. Laidlaw Lumber Company, at the corner of Eastern Ave. and St. Lawrence Street, Toronto, recently suffered a very heavy loss by fire. The building was destroyed and the damage to the plant and lumber piles amounted to about \$50,000, most of which was covered by insurance.

The Montreal Box Board Company, Limited, has been incorporated with a capital of \$500,000, with head office at Montreal, Que., to carry on business as manufacturers of paper, pulp, or strawboard, boxes, etc. The provisional directors are J. W. Blair, advocate, and F. J. Laverty, K.C., of Westmount, Que.; and C. A. Hale, advocate, of Montreal, Que.

The incorporation of the John C. Gilchrist Lumber Company, Limited, of Toronto, was recently announced in these columns. The company report that the object of the incorporation is to continue the business formerly carried on under the private name of C. Gilchrist at 188 Perth Ave., Toronto. The directors are John C. Gilchrist, president; Geo. H. Gilchrist, vice-president; Geo. C. Paterson, secretary-treasurer, and Sinclair M. Gilchrist.

The Colonial Lumber Company, Pembroke, Ont., have purchased from Fraser & Company of Ottawa, their Deep River Limit, which has an area of about 170 square miles and about 20 square miles of frontage up the Ottawa River. The limit contains a large amount of first class pine, much of which has never been cut, except for the purpose of picking up a few sticks of timber many years ago. The limit also contains a large amount of oak and birch which, on account of its close proximity to the company's mill, can be manufactured to advantage. The lower part of the limit is on Allumette Lake, within thirty miles of the mill. The hardwood logs can be mulinnetted with soft wood and towed to the mill, or brought down by steam barge. The Colonial Lumber Company expect to increase their present output by three to five million feet of hardwood per year, comprising oak, birch and maple. They expect to commence operating upon this limit during the coming season.

Eastern Canada

The sash and door factory of Mr. H. Fauteaux, Fauteaux Lave, Montreal, has been slightly damaged by fire.

The sawmill at St. Jerome, P.Q., owned by Joseph Bouchard, was recently destroyed by fire. The loss amounted to \$5,000.

Poulin & Bessette, sash and door manufacturers, Cowansville, P.Q., have been registered. The members are S. Poulin and R. Bessette.

A small sawmill, owned by Daniel M. Silass, was destroyed by fire recently at Eel River, N.B. The loss was about \$3,000, and the insurance \$1,000.

The Brompton Pulp & Paper Company, East Angus, P.Q., have drawn up plans for a new pulp mill and power house. The mill will be two storeys, 72 x 144 ft. and the power house will be one storey, 52 x 108 ft. The engineer

is C. A. Ring, East Angus. The buildings will be of brick and steel construction, with concrete foundation.

Stebbens & Menard, sash and door manufacturers, St. Paul d'Abbotsford, Que., have been registered. The members are Joseph Stebbens and P. H. Menard.

The sash and door factory belonging to Z. Berthiaume, 694 Alma Street, Montreal, P.Q., was recently destroyed by fire. The loss, which amounted to \$4,000, was covered by insurance.

The Standard Pulp and Lumber Company, Limited, has been incorporated, with a capital of \$1,000,000, with head office at Montreal, Que. The provisional directors are C. Beauchemin, J. A. Richard, and P. Lavigueur, lumber merchants, of Montreal, Que.

The Beauce Pulp & Lumber Company, Quebec, P.Q., who lost their mill at Scotts Junction by fire last July, report that they have sold all their property at Scott and on the Chaudiere River to the Quebec & St. Maurice Industrial Company and therefore will not rebuild the mill.

La Compagnie Industrielle Lacroix de Contrecoeur, Limitee, has been incorporated, with a capital of \$49,000, with head office at Contrecoeur, Que., to carry on business as dealers in timber limits, sawmill owners, etc. The provisional directors are J. A. Lacroix, manufacturer, and F. X. Gervais, of Contrecoeur, Que.; A. Lacroix, joiner; J. A. H. Dequoy, notary, and J. Lamoureux, of Montreal, Que.

Finch, Pruyn & Company, Inc., Glens Falls, N.Y., expect to start their new steam sawmill, on the Henri River near Laurier Station, on the Intercolonial Railway, about April 1st. They have a large cut of logs ahead at this point. The mill will cut both hardwood and soft wood, but will commence upon the hardwood first. The mill is up-to-date in every respect being furnished with entirely new equipment, including a band saw, vertical resaw, lath mill, etc., with a large piling ground, ample railroad siding and other conveniences. The logs will be brought to the mill by rail and it will be possible to cut all lengths up to 32 ft. long. A number of buildings have already been erected in the vicinity of the mill.

Western Canada

McVicker & Burke, Vancouver, B.C., have erected a shingle mill at Burquitlam, which will be operated by electricity.

The Stern Lumber Company, Limited, has been incorporated, with a capital of \$10,000, with head office at Donald, Alta.

The Parks Lumber Company, Verwood, Sask., recently suffered loss by fire at their lumber yards, to the extent of about \$3,000.

Preliminary contracts have been let by the Empire Lumber Company in connection with the large plant which it will establish on Vancouver Island.

The Western Canada Lumber and Building Company, Limited, has been incorporated, with a capital of \$300,000, with head office at Saskatoon, Sask.

A report from Blairmore, Alta., states that the McLaren Lumber Company contemplates the erection of a mill at a cost of \$200,000, and that the company will require new machinery, boilers, etc.

L. H. P. Lloyd's mill at Westholme, Vancouver Island, has been bought by R. S. Henderson, of the Tyee Lumber Company, who now has four mills on the island, with a capacity of 125,000 feet daily.

A report from Chilliwack, B.C., states that Mr. H. Windebank of Mission has purchased 1,000 acres of timberland on Silver Creek and intends to log it. He will build a mile of railroad to reach the timber, also a dam to conserve the water supply on Silver Creek.

F. T. Cruttenden, Lethbridge, Alta., will shortly call for tenders for a planer, jointer, lath trimmer, saw table, 5 h.p. motor, 10 h.p. motor, 2-phase, boring machine and five quick acting vices. He plans to invest about \$2,000 in equipment for his woodworking plant.

The Coast Range Cedar, Shingle & Lumber Company, Limited, has taken over the premises of the Cedar Cove Sash and Door Factory at Cedar Cove, Burrard Inlet, B.C., and have installed shingle machines and cedar manufacturing machinery. John Thompson of Vancouver is the principal member of the firm.

A report was recently published to the effect that Mr. E. J. Chamberlain, president of the Grand Trunk Pacific Railway was interested with others in the erection of a mill at Dowe Creek, on the Upper Fraser River. Mr. Chamberlain advises us that this report is incorrect and that he is not interested in this or in any other lumber company doing business along the line of the Grand Trunk Pacific Railway.

The British Columbia Sulphite and Fibre Company, which owns a pulp mill on Howe Island, B.C., has bought from the provincial government 1,070 acres of timber on Sutlej Channel and are undertaking to have the area cleared in three years. The holdings comprise 6,000,000 feet of hemlock, 2,000,000 feet of larch, and 3,000,000 feet of cedar, the hemlock and larch bringing ten cents a thousand in addition to the royalty and the cedar 25 cents a thousand. For 950 acres on Broughton Island, bought by the same company, 15 cents was paid for the hemlock and larch, and 40 cents for the cedar in addition to the royalty. The timber contents of the latter area are 9,000,000 feet of hemlock, 4,000,000 feet of larch and 1,500,000 feet of cedar.

Educational Talks on Leather Belting.

Progress Made in the Manufacture of Leather Belting

In the construction of leather belts in the early days of the industry, the whole hide was cut into strips which were riveted together, so that the one grade of belting produced was made from leather that varied in quality, thickness and weight. This belting for several years answered all purposes for which belting was used.

The development of modern efficient machinery necessitated the manufacture of higher grade belting to meet the increasingly severe requirements.

Careful study in work-shop, testing-room, and laboratory has resulted in the selection of of hides, and the adaptation of processes and materials to produce several brands, or weights of high quality belting each peculiarly suited to certain conditions of service.

The rigid maintenance of this exact standard of quality, weight and thickness for each brand, in contrast to the old-fashioned methods mentioned above, is of vital importance, as it assures under similar conditions uniform service from any given brand of belting.

The improvement in leather for belting would have availed little had we not at the same time perfected a cement for joining laps, the use of which has superseded the old-style weak-riveted joint, and proven in actual service the strongest and most efficient method of constructing belts.

To determine the most efficient and economical quality, weight and thickness of leather belting for any particular drive it is essential to know:

First:—Whether for a horizontal drive or vertical drive.

Second:—Open drive, drive with idler, or quarter turn drive.

Third:—Diameter of pulleys.

Fourth:—Revolutions per minute of driving pulley.

Fifth:—Horsepower to be transmitted.

Oak Tanned Leather Belting, as it has been developed, is recognized as the best belting for ordinary conditions. For certain unusual and exacting demands, however, we make a belt—our SPARTAN BRAND—using specially tanned leather and special cement—a belt remarkable for its pliability and, consequently, increased pulley grip, great tensile strength and resistance to steam, water, oil, heat and chemical fumes.

A comparison of the crude leather belting of early days, with our remarkably efficient modern product, will prove that our industry is well abreast of the day in mechanical progress.

Subject for next month:—“*Proper Selection of Belts*”

Show a man how to save money on roofing and you'll get his trade

Wouldn't you give your trade to a man who showed you how to save money.

Of course you would!

And for that very reason you can outsell any other dealer in your town when you handle

J-M ASBESTOS ROOFING

Gives Absolute Fire Protection

This roofing saves money because its life is about as long as the life of the building. Because you never have to touch it after it's applied. Why? Made of Asbestos rock fiber felt, impregnated and cemented together with Trinidad Lake Asphalt, both coming from the earth and as old as Time,—imperishable mineral substances.

The J-M Cleat makes the application easy and perfect. Joints made with this device are vise-like and never leak or tear. The Cleat is the greatest improvement yet made for applying roofing. It's the cheapest roof per year of any, not considering its fire protection, which is worth its cost.

These facts command instant consideration with prospective purchasers of roofing.

Write for special dealer proposition. Remember: only one dealer to each town, so write today.

Brake Your Load and Save Your Horses

Besides avoiding accidents and eliminating sand hilling this braking device can greatly reduce your hauling costs. Larger loads may be handled and fewer men employed.

Barienger Braking Device for letting heavy loads down steep hill and mountain roads. Saves horses and expense of sand hilling.

Our catalogue fully explains

 Carthage, N. Y.

GOODHUE BELTING

For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue belt will always run evenly and "clings" to the pulley transmitting 100 per cent. of your power.

For the wet places in the mill we have a special waterproof leather belt—"Acme". Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

A New Swage The Best Yet United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

Newburgh, Ontario

They Have Brought Both Sides of the World Closer Together

While the first Band Saws were made and used abroad, it is in America that they have seen their greatest advances—both in manufacture and use—for in France the early Band Saws were narrow and used only for such work as scroll sawing. It was left to America to improve the Band Saw and first apply it to the manufacture of lumber. In their efforts to keep pace with the increasing requirements of millmen Henry Disston & Sons have brought the Band Saw to its present high state of perfection.

The fame of Disston Band Saws, however, has not been confined to the Western Hemisphere. Their use has spread out year by year, from country to country. We are now shipping Band Saws to all sections of the World.

DISSTON BAND SAWS

"They make the world go round"

They have brought both sides of the World closer together for if a club were formed of Disston Band Saw users its members would be found in almost every country on the globe.

When you take into consideration the vastness and importance of the lumber and woodworking industries all over the world, and the fact that the majority of those who use Band Saws insist on the Disston Brand, it can truly be said that "they make the World go round." No matter where you are located there is a Disston Branch near enough to give you all the facts. Write them, and "Depend on Disston."

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... 3 feet by 6 feet 3 inches
Diameter and Length Mandrel ... 2 3/16 by 55 inches
Size Drive Pulley ... 20 by 10 inches
Feed per Revolution of Saw ... 0 to 3 1/4 inches
Feed Belt ... 4-inch Gandy
Largest Diameter Saw ... 56 inches
Length of Carriages ... 12, 16, 20 or 24 feet

Width of Carriages ... 33 inches
Trucks ... 7-inch wheels and 1 1/4-inch axles
Length Track ... 32, 40, 48 or 56 feet
Style and Opening of Blocks ... C1-36 inches
Style Mill Dogs ... Pony Excelsior
Style Set Works ... No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis., a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Elevating, Conveying and Transmission of all kinds a specialty

Have you investigated this Wonderful Cost Reducer?

A ^{FAY-EGAN} "LIGHTNING" 333-335 Matcher-Resaw Outfit lowers manufacturing cost by eliminating handling, increasing output and raising grades

Because of keen competition, you lumbermen are studying methods of lowering manufacturing costs. You must give your customers good lumber and still make your profit.

Manufacturing costs can be lowered in two ways—by eliminating handling, and by doing away with degrading loss due to manufacturing defects.

To illustrate the first, investigate the Fay-Egan 333-335 Matcher-Resaw with Resaw below the bed-line of Matcher.

By your old methods, you make bevel siding, shiplap, ceiling, etc., double thick on a Matcher at about 75 ft. a minute, then you truck to a Resaw and feed at about the same rate. This requires two feeders and two off-bearers and a whole lot of your stock is torn out, fuzzy, uneven and otherwise lowered in grade.

With a 333-335 you match double thick and resaw in one operation, requiring only one feeder and one off-bearer—instead of 75 ft. you get 200 ft. a minute and every bit of your stock grades up to No. 1.

This means a reduction of at least 50% in manufacturing costs and an increase of from 10 to 30% in market value of your product.

You may be making pattern work—then you should investigate the 333-288 Matcher-Profilier.

Or if you are getting out flooring or plain four side matching, look into the regular 333 Matcher.

A "333" installation is made up of units which can be coupled together to meet your individual requirements.

Let us study the proposition with you and for you.

As a starter along this line, read our book on Fast Free Matchers, Surfacers and Appliances. A copy will be sent free upon request if you use your own or company letter head. Ask for Book No. 87

The Steam Tension Band Mill

THE top guide on this mill, as well as the upper wheel, is operated by a steam cylinder.

This means that the guide can be moved up or down instantaneously, which in one day's work means quite a saving of time over the ordinary mill. This goes a long way towards paying for the mill by the end of a year.

But this is not all—with this steam operated guide it is just as easy to keep the guide close to the cut as it is to set it for certain size logs and keep it

there. This can be done without loss of time, and so by bringing the guide down close to the cut, vibration of the saw is done away with and the quality of the lumber is improved.

No form of tension yet devised is as easy on the saws as the steam tension—several of the users of this mill have run through an entire season without cracking a single saw.

These are some of the reasons why our steam tension band mill is the most economical mill to buy, and there are others which you will find in our catalogue.

When you are tuning up your mill this winter for next season's operations, remember that we can serve you promptly whatever your requirements may be.

Is there Rosin in Cling-Surface?

Cling-Surface contains less free organic acids than any other manufactured or natural substance suitable for the treatment of belts and ropes.

That Cling-Surface contains only the purest and most preservative materials is evident from the following reports of the highest authorities in their respective fields and countries: Prof. Orndorf, Cornell University:—

"No rosin, no free alkali, no free mineral acid, no free ammonia present."

Ernest J. Parry, B.Sc., T.J.C., F. C. S., Analytical Chemist, London:—

"Free from any matter which would have corrosive effect on leather, canvas, cotton or similar fibers. In my opinion a perfectly suitable lubricant for leather belts or fibers of any kind."

Dr. J. Gordon Parker, London: "No mineral acids, nor was I able to find any ingredients likely to be detrimental to leather, canvas, cotton or other belting. It acted very beneficially on belting in my laboratory."

Dr. Gartenmeister, Elderfield, Germany:—

"No mineral or other damaging products, no tar, rosin or rosin oil. No products which would damage leather, camel's hair or cotton belts or hemp or cotton ropes."

Prof. E. Karsch, of Cologne, received the following report from the German Royal Material-Testing office:—

"Free mineral acids, free alkali and resin are not present. Mineral substances, wax, resin, resin oil and free

organic acids are not present in any quantities which can be detected."

We might continue references endlessly, but the use of Cling-Surface all over the world for sixteen years has been the best demonstration of its basic value.

Every pound of Cling-Surface is guaranteed. It must satisfactorily stop slip and preserve the belts or ropes, or you can have your money back. Write for literature.

We quote f.o.b. Toronto.

----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Good Lumber HORSES

Should be free from all blemishes

Use

ABSORBINE

for Wind Puff
Capped Elbow,
Bog Spavin,
Thoroughpin,
Shoe Boil,
Curb, Enlarged
Glands and all
puffs and swell-
ings, Fistulla,
Poll Evil,
Sprains, Con-
tracted Ten-
dons, Bruises,
Lameness of
all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit. The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

best friend—it relieves the horse of all pain, soreness and trouble—some blemish. It makes the horse better looking, better working, more fit and of greater value to you. You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use.

Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too. All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 a bottle at druggists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

MONTREAL, CAN.

Annihilate Scale

Potato Scale will positively remove scale from your boiler tubes and can do no injury to your pipes or fittings. Feed water should be regularly treated with Potato Scale to prevent scale, pitting, grooving and honeycombing; it saves fuel and so treats the water that it absorbs more steam.

Send us a gallon of feed water which we will analyze and then mix a sample of potato scale to suit your conditions—this is a free trial, write us.

BAND RESAWS

Saginaw Band Resaw

Geridge, Lonoke County, Ark.,
November 3rd, 1913.

Gentlemen:—

We have now used your Saginaw Band Resaw for one year and have only the highest praise for it. It turns out perfect lumber and were we to purchase another saw, it would give us great pleasure to have you build one for us.

Yours very truly,
Varner Land &
Lumber Co.

Wm. B. Mershon & Company
SAGINAW, MICH.

Provide for the Future **NOW!**

In every lumber manufacturing section of North America are to be found crumbling ruins of mills whose owners elected to depend on the open market for their log supply, who refused to invest their good money in standing timber.

In practically every case the "Open Market" has proven an unreliable source of log supply. Farsseeing operators have come in, sized up the supply of timber tributary to certain points and bought the bulk of it. Many of the mill owners who had the first and the best opportunity to purchase, because of their neglect, have been forced out of business and have seen their investment in plant and equipment depreciate to the extreme low limit of its value as junk.

Does that possibility confront you?

If it does, please bear in mind these facts:

Now is the time to provide for your future supply.

We can give you exactly what you need.

Your copy of "Washington Red Cedar, America's Overcoat Wood," Lumber Users Guide No. 12 awaits your request. Send for it.

Lumber Camp Ranges and Heaters

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

Write for our catalogue.

Horizontal Slab Re-Saw

A Horizontal Slab Re-saw will increase the capacity of a saw-mill from 15 to 25 M ft. at a less cost for equipment and a less cost for operation, than can be accomplished in any other way.

One customer in Canada has purchased 7 of our Re-saws, another 4 and another 3. Catalogue gladly furnished without obligation to you. It also illustrates many special Box Factory Machines.

KEEP THE WORK GOING

Nothing is more important in logging than the prompt and certain movement of cars.

Delays affect the whole work. To avoid delays, locomotives must be reliable and always ready for service.

Our standard logging locomotives are built to insure reliability and constant service. Only tested materials are used in their construction. All wearing parts are made to templates and gauges. Interchangeability of like parts is guaranteed, and long delays waiting for duplicate parts avoided.

HEISLER GEARED LOCOMOTIVES

Especially adapted for heavy hauling on steep grades, sharp curves and uneven tracks. For logging, switching and pulling on main lines, mills, furnaces and industrial purposes.

Engine being operated by the Trout Creek Logging Co., Ltd. of Trout Creek, Canada

Just Off the Press—New Detailed Descriptive Catalog 108 G.C.

Heisler Locomotive Works

ERIE, PA., U. S. A.

Whitney Engineering Co., Tacoma, Wash., North Western Sales Agent

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**For Logging Operations**

Our Logging and Industrial locomotives are not mere engines from stock, but specially designed locomotives for logging use. They operate with a minimum of fuel consumption and can be relied upon to give steady service every day of the year. All parts are amply designed, lessening the possibility of breakage. Send for Specifications.

We are also builders of Stationary Boilers, suitable for Contractors and Industrial Plants.

Canadian Locomotive Company, Limited, Kingston, Ont.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

DIRECT ACTING STEAM FEED
WITH MODEL "D" VALVES

A STEAM FEED, especially when fitted with our model "D" valves, is such a great time saver over a friction feed that it will make an enormous increase in your lumber production, with no additional labor.

Do not decide that your boiler capacity is too small until you have consulted our engineering department. The power required by our feeds is surprisingly small, and we will *guarantee results* on any installation.

We make these feeds in all sizes, including one for *your* requirements.

SHALL WE SEND OUR BULLETIN? IT'S WORTH WHILE.

Waterous Boilers

Are Best For Sawmill Use

To get the full steam value out of the fuel you burn install Waterous Return Tubular Boilers. It will pay you for these reasons:—

They are economical of fuel—they carry plenty of steam in reserve for use in emergencies—they can be used with hard and dirty water—they are easily cleaned and readily taken care of.

Furthermore, we build various styles of boiler settings that are dimensioned and designed to best handle the various fuels used in the sawmill. Whatever kind you use, we will install your boiler to give you the highest possible efficiency and most perfect combustion with it.

We build and carry in stock Return Tubular Boilers up to 72" x 18'. If we cannot supply you at once from our yards we can turn out your order in quick time. Ask us for prices on the next boiler you buy.

We build complete Power Plant Equipment for every size installation—Catalogues and Prices on request

"FROST KING" METAL

\$5,000,000.00

worth of mixed metal
sold annually.

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

Right Footwear for Lumbermen and Sawmill Workers.

Ordinary boots or shoes are useless where there is much dampness or wet. For thirty years we have been making our celebrated oil-tanned waterproof footwear from the finest leather procurable, tanned by our own secret process and known as Skowhegan Leather.

This footwear has been sold under the name of

PALMER'S "Moose Head Brand"

and has won a reputation. It represents the best in leather, best in workmanship, best in actual use. It fits better, looks better and wears better than any other make. We have reached the mark we aimed at when starting in business thirty years ago—to produce the best oil-tanned waterproof footwear in the world.

We make them to measure and sell them by mail. Send for free booklet with self-measuring diagram to-day.

John Palmer Co.
Limited

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at \$26,774,937 or 40% of Canada's total output.

Pine production, 354,260,008 ft. B.M.

Pulpwood, 131,434 cords.

Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.

Are You Turning Variety Wood-work with a "Defiance" Patent Variety Turning Lathe?

If not, we know it will be to your advantage to let us install in your plant a modern, labor-saving lathe that will come up to your expectations in every respect.

Time has Tried and Tested this Machine

And it has never been found wanting. Exact duplicates are always turned in either round, oval, hexagon, octagon, or square pieces.

This is a speedy machine and can be handled by inexpensive labor. We build it in various lengths from 18 in. to 72 in.

Solid and Inserted Tooth Circular Saws

We make a specialty of these lines

**We remake old Solid Tooth Saws
into new Inserted Tooth Saws**

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 8

Ontario's Workmen's Compensation Act

The approaching enactment of a workmen's compensation law by the Province of Ontario is an event which will be of the greatest importance to the lumbering industry, and which, under the bill as prepared by the Commissioner, contains factors of such a serious nature that lumber industries, woodworkers and all who are connected with the industry in any form will find themselves face to face with a new situation which is likely to alter materially the conditions under which they carry on their business. The situation, is in fact, so serious that the lumbering industry in Ontario should do everything in its power to co-operate with the Canadian Lumbermen's Association and the Canadian Manufacturers' Association in their efforts to cope with the difficulties which will inevitably arise under the crude and impracticable form of the Act which is being imposed upon the province.

Briefly, the bill provides that compensation for injury must be paid to an employee regardless of questions of negligence. The compensation is to be adjusted by a government-appointed commission and paid out of funds to be secured by a tax upon employers in groups. The compensation is to be based on certain schedules and percentages fixed by the Act, the maximum being 55 per cent. of the injured man's former earnings; which payment is to be continued during the period of disability, and if necessary for life. In cases of death certain fixed monthly payments are to be made to the widow during her life or to other dependents for varying terms.

No employer, however anxious he may be to make a profit out of his business will reasonably object to the principle of compensation for industrial accidents so long as that compensation and the system for its administration are worked out on a business basis and with due regard to business considerations. The proposed bill, how-

ever, is so inconsistent with elementary business considerations and so unworkable in its present form that any attempt to operate it will require the careful and intelligent co-operation of employers, individually and collectively, if the bill is not to be a source of serious embarrassment and perhaps ruin to some of our industries.

The proposed Act divides employers into three, or rather four, general divisions. Manufacturers, lumbermen, builders, etc., are placed under a compulsory mutual insurance system administered by the proposed Commission. Railways, navigation companies, municipalities and others are placed under the jurisdiction of the same Commission so far as adjustment of claims is concerned, but are not to be insured in the state system though they may be compelled to insure in an employers' liability insurance company. The great mass of other employers such as wholesalers, retailers, professional men, etc., are placed under a new and drastic liability law whereby they become subject to an action in the courts for unlimited damages without being able to plead that the injury was due to the contributory negligence of the workman or to the negligence of a fellow servant. A fourth class—farmers and employers of domestic servants, are excluded from the operation of this latter part of the Act and so form a fourth group. It would be incorrect, however, to say that these classes do not come under the Act at all, for, in so far as any farm hand or domestic servant may be engaged in manufacturing he would apparently come under the same law as the manufacturer. "Manufacturing" is defined to include: "making, preparing, altering, repairing, ornamenting, printing, finishing, packing, assembling the parts of and adapting for use or sale any article or commodity."

Absurd as it may seem the farm hand engaged in any operation covered by this definition would be literally under the same law as a workman in a factory.

One of the most difficult and unsatisfactory features of the bill is the vagueness of the line, if there is such a line, between the regularly established lumberman and the farmer who may casually cut a log or two in his bush. It would appear that if a farm hand were injured in the course of cutting down a tree for lumber his compensation would be paid out of the lumbermen's fund. In other words, he would be considered as being insured in that fund. The question arises, however, whether it is probable that every farmer who casually engages in lumbering for a few days will have paid his premium or assessment into the lumbering fund. If the premium has not been paid the workman will nevertheless get his compensation out of the fund—which means that the other contributors to the fund have paid the insurance. Even if the farmer comes in after the accident has happened and pays his premium the bulk of such insurance will have remained unpaid since for one farmer who has had an injury a hundred, who should also have paid their premium, may have escaped. It would be as if a property owner could come to the fire insurance company after the fire and pay his premium and collect his insurance.

The above is illustrative of scores of difficulties and anomalies, some of which lie on the face of the Act as it stands and others of which are apparent only after more careful study. There is every reason to believe that the government is perfectly aware of the faultiness of the measure; but having had the bill prepared by the Chief Justice of Ontario it is apparently thought incumbent upon the government to adopt the measure substantially as prescribed. The plea of the government is that the details must be worked out by the administering Commission and that the necessary amendments can be made at a succeeding session of the Legislature. Probably one of the most remarkable and unsatisfactory features is the tremendous power which it is proposed to vest in the administering board. It is the custom in appointing an administrative body to circumscribe its powers and jurisdiction as definitely as it is possible to do. In the nature of things any other policy would involve the gravest dangers. The proposal in this Act, however, is to leave the administering Commission in the widest possible manner arbiter of its own jurisdiction and the interpreter of its own powers. Furthermore,

every effort is made to preclude any possibility of appeal from its decisions though in this the bill has over-shot the mark with the probable result of necessitating an immense amount of litigation before the most elementary questions of jurisdiction are determined.

Under the scheme of subdividing industries into groups, as included in the schedules of the bill, schedule 1. covers industries in which employers are liable to contribute to the general accident fund. The first four classes of this schedule are as follows:—

Class 1.—Lumbering; logging, river-driving, rafting, booming,

sawmills, shingle mills, lath mills; manufacture of veneer and of excelsior; manufacture of staves, spokes, or headings.

Class 2.—Pulp and paper mills.

Class 3.—Manufacturers of furniture, interior woodwork, organs, pianos, piano actions, canoes, small boats, coffins, wicker and rattan ware; upholstering; manufacture of mattresses, or bed-springs.

Class 4.—Planing mills, sash and door factories, manufacture of wooden and corrugated paper boxes, cheese boxes, mouldings, window and door screens, window shades, carpet sweepers, wooden toys, articles and wares or baskets.

Wrongful Use Injures Market Conditions

The objections which Canadian lumber manufacturers have to the importation of yellow pine into Canada are based more upon the improper use of certain classes of pine, rather than its extensive importation. For certain purposes, the use of longleaf yellow pine in Canada is acknowledged to be necessary and Canadian lumber manufacturers have no objection to fair competition from this source. The real objections are based upon the importation of low grade shortleaf yellow pine which is especially subject to the attack of dry rot. This class of material, when used ignorantly in places for which it is not suited, has been the cause of widespread criticism of yellow pine in general. In the consideration of this matter it is interesting to note the views recently expressed by Dr. von Schrenk, consulting engineer of the National Lumber Manufacturers' Association. Dr. von Schrenk exhibited pieces of factory timbers that had been taken from a Canadian factory, after having been attacked by dry rot, within a comparatively short time after being used in the construction of the plant. This example was one which led the speaker to dwell at some length upon the necessity for better methods of salesmanship on the part of manufacturers. In Canada, he said, as a result of re-

pairs and reconstruction made necessary in some of the big plants by reason of the poor quality of pine used in their construction, a widespread feeling had developed against yellow pine, a feeling that was most unjust.

In the Canadian plant from which the examples exhibited were taken the specifications had called for high grade longleaf Georgia pine. The material furnished had been a very poor grade of loblolly, or North Carolina pine, totally unfit for the purpose for which it was used. He believed that the manufacturer who supplied the material was entirely unaware of the use to which the timber was to be put. The average lumberman was the poorest merchant on earth. Before filling a specification for timbers or lumber, the manufacturer ought to find out the purpose for which it was to be used and if the material called for was unfit for that particular purpose he should endeavor to have the specifications changed and substitute the proper material. The sample of factory timbers with the dry rot, he said, indicated simply a case of fool application, and if the manufacturer had known what it was to be used for, he would not have sold the timber.

A Washington View of B. C. Royalty Act

A Washington letter to a number of newspapers in the United States, prints the following relative to the recent Timber Royalty Bill passed at the last session of the Legislature:

"The Canadian Province of British Columbia is showing the way to all other governments in the matter of doing things for the common people. The B. C. Legislature passed a law introduced by the Minister of Lands, Hon. Wm. R. Ross, which assures to the citizens of that province an income, within ten years, of three million dollars a year from royalties on publicly-owned timber. This Act, according to information which comes to interested public men in Washington, does for publicly-owned timber in British Columbia, what the conservationists, under the leadership of Gifford Pinchot, have been trying to secure for the people of the United States

"The Act retains in the Provincial Government, for the people, the fee simple title to all timber lands; it permits the taking of timber claims one mile square at an annual rental of \$120 per claim, and for the payment to the government of a stumpage price which rises gradually with the increased value of timber. Under the old Act of 1905, the stumpage price per thousand feet was 50 cents. The new Act increases it to 75 cents a thousand feet, effective in 1915, and provides that five years later there will be added to the royalty price

25 per cent. of the increased value of lumber at that time, above a minimum price of \$18 per thousand, each five years thereafter the same thing will be done again, the percentage taken by the government to increase gradually from 25 to 40 per cent., the whole arrangement covering a period of about 40 years.

"This means, first, that the lumbermen get a reasonable profit out of their operations—the government takes nothing unless the price is above \$18 a thousand. It means further, that the government, the people, share in the increased value of their timber. It establishes a great profit-sharing, co-operative principle, in which the government and the timber operators are partners. The government retains the title to the land, and their right to prescribe the way in which the timber shall be cut. The people's interest is protected, and at the same time lumbermen are encouraged to take up holdings and develop the timber industry.

"The great lesson for the United States in this B. C. Royalty Act lies in the recognition by the Provincial Government that the people should share in the increasing value of their own property—a principle which American conservationists under the leadership of Pinchot, have been and are fighting to have enforced in the development and use of public waterpowers in the United States."

Will Teach the Lumber Business

At the request of prominent lumber interests, a two-year course in the business of lumbering is to be opened next year by the Harvard Graduate School of Business Administration, in co-operation with the Harvard Forestry School. In a bulletin announcing this course, the school makes the following interesting references to the situation:—Rising labor costs, coupled with decreasing labor efficiency; higher prices for all supplies and machinery; and the nearly complete absence

of scientific knowledge of the business of manufacturing and marketing lumber, have brought some of the largest owners and buyers of standing timber to a pass where they seem to face certain and heavy loss unless present methods can be greatly improved in the near future.

It has been found that forestry education, after the German pattern, does not meet the needs of the lumbering interests. It is good, and necessary, the lumbermen admit, to know how to protect existing

tree growth, and to start new growths. But the present and acute problem is how to manufacture the existing trees into lumber and to sell the lumber at a profit.

Labor changes have played perhaps the largest part in bringing the lumbering interests to their present difficult pass. Ten years ago the men of the lumber camps and mills were predominantly Yankees and men of the northern European races. They have been replaced by French-Canadians, and a medley of South and East Europeans—Greeks, Poles, Hungarians, and others,—who are known under the collective name of "Bohunks." The new labor is constantly shifting. Three men are now needed to do what two men formerly did. Wages and supplies of every sort are higher. The French-Canadians are good axe men, but they are "too flighty to be left to themselves. If 'something happens' they go all up in the air." The "Bohunks" are inferior to the French-Canadians, are unreliable, and require constant supervision.

In the mills there is a similar lack of economy and efficiency. Hardly a lumberman in the country knows just what his product is costing him. To many manufacturing lumbermen the idea of figuring depreciation on a mill plant is strange and incomprehensible. So also, charging interest on the capital invested in the plant is a

new idea. Similarly, the mills themselves are usually inefficiently arranged. Hand labor is found carrying material in the mill that can be handled much more cheaply by mechanical conveyors. Plants in general are imperfectly laid out, and there is waste of labor and of time in all of the ways that the efficiency engineer has made familiar as wastes by his reform in other types of manufacturing plants.

Much lumber is being manufactured that it doesn't pay to work up. A recent investigation by a member of the Harvard Forestry School faculty showed that a certain company was working up something like forty per cent. of its logs at a dead loss. The boards from logs of less than a certain diameter did not bring enough to pay for cutting them out of the log. The discovery of this fact required careful cost accounting from the living tree, to and through the mill, and into the final market.

The whole manufacturing and marketing end of lumbering is in greatest need of just such scientific study as this example shows. Manufacturing costs must be reduced to compensate for increasing labor expenses, and this means the re-arranging of plants for greatest economy of operation, the substitution of cheap mechanical handling for hand labor wherever possible, and the exclusion of all material that will not pay a profit on the working up and marketing.

Railways Want Payment for Spotting Cars

A matter of great importance to shippers of lumber to and from points in the United States is the recent application of the railway companies of the United States to the Interstate Commerce Commission for permission to impose a charge for the service of spotting cars. This application is being opposed vigorously by many of the lumbermen's associations in the United States, among them the National Wholesale Lumber Dealers' Association, which has prepared a concise, but forcible brief for presentation to the Interstate Commerce Commission. The brief calls attention to the fact that, for a great many years, it has been the policy of the railroads, both in the United States and Canada to encourage the construction of industry spurs, and this has not been limited to any particular industry. This policy has enabled the carriers to develop their traffic to an enormous extent, with comparatively little outlay on their part; in fact, in a great many instances, they have made no outlay whatever. A large percentage of the business of the country has been built up on this basis. This railroad rate has always been recognized as covering not only the conveyance of a shipment, but the full service, which includes furnishing the car, a proper place at which to load it, the conveyance of the car and its terminal delivery. Deliveries to industry spurs do not constitute a service for which carriers can rightfully make an additional charge. The brief points out

therefore, that delivery on a public steam track is a service which is not obtained by industries having spur tracks. Spur track delivery costs the carrier no more and in the majority of cases less than public team delivery, and it might even be argued that an industry with a spur track should be required to pay less for accepting delivery at such a point, which is less expensive to the carrier. An industry spur is, in fact, of immense advantage to a carrier, assuring it, the traffic of that industry, both inbound and outbound. Industry spur tracks increase the terminal facilities of the carriers, at little or no expense to themselves, and in many cases are constructed at much expense to the industry itself. Moreover, they encourage much more rapid unloading and releasing of cars.

In conclusion the brief calls attention to the fact that if a spotting charge were adopted and even a small percentage of industries with spur tracks were to demand the proper placement of their cars on public team tracks, terminals would undoubtedly become congested involving serious embarrassment.

The volume of trade in lumber between Canada and the United States is so extensive that this question is of much importance to Canadian exporters and importers and the result of the application to the Interstate Commerce Commission will be awaited with widespread interest.

Canada's Exports of Forest Products

Exports of forest products from Canada during the twelve months ending January 31st, 1914, were valued at \$42,707,781, as against \$42,873,710 in the twelve months ending January 31st, 1913, and \$40,691,814 during the twelve months ending January, 1912. For the twelve months ending 1911, the total value of exports of forest products was \$46,155,909.

Exports of wood and manufactures of wood during the twelve months ending January 31st, 1914, and the twelve months ending January 31st, 1913, were valued as follows:—

	1913	Total	1914 To United Kingdom	To United States
Wood and mfrs. of—Total	49,160,051	49,629,065	12,277,867	33,682,727
Logs	1,068,247	529,281	120,150	398,726
Lumber—Deals, pine	1,462,022	1,352,430	1,262,870	64,793
Deals, spruce and other	5,582,410	6,566,062	5,959,156	515,445
Laths, palings and pickets	1,943,152	1,952,099	24,060	1,895,013
Planks and boards	20,289,807	19,851,892	1,842,830	15,380,085
Shingles	1,372,455	1,531,824	292	1,494,968
Timber, square	1,799,946	584,440	557,778	12,323
Wood blocks for pulp	6,450,504	7,082,385	7,082,385
Wood pulp	5,444,474	6,094,657	1,232,268	4,559,909

Imports of wood and manufactures of wood for the twelve months ending January 31st, 1914, from the United States were

valued at \$24,934,988. The total from the United States and the United Kingdom was \$26,194,973, as compared with \$26,852,755 during the twelve months ending January 31st, 1913.

During the ten months ending January 31st, 1914, imports of some of the important classes of forest products from the United States were valued as follows:—fence posts and railway ties, \$2,087,687; planks, boards, etc., dressed on one side only, \$3,877,843; timber, hewn or sawn, etc., \$477,250; pitch pine, \$2,586,269; oak, \$2,261,653.

Exports of forest products for the ten months ending January 31st, 1914, to the United States included the following:—planks and boards, \$13,670,161; shingles, \$1,535,781; scantlings, \$762,026; pulpwood, \$6,092,937; chemical wood pulp, \$2,020,373; mechanical wood pulp, \$1,850,531.

Exports of forest products to Great Britain during the ten months ending January 31st, 1914, included the following; pine deals, \$1,258,792; spruce deals, \$545,744; deal ends, \$246,124; planks and boards, \$1,697,593; scantlings, \$358,329; white pine square timber, \$311,890; red pine square timber, \$31,343; oak timber, \$258,619; elm timber, \$310,847; birch timber, \$111,136; mechanical wood pulp, \$1,131,742; chemical wood pulp, \$5,412.

The Western Freight Rates Judgment

Dominion Board of Railway Commissioners Gives its Decision Reducing Scale of Charges in Western Canada—Lumber Rates Unchanged—Details of Finding.

Judgment has been given by the Dominion Board of Railway Commissioners in the Western Freight Rates case, which involves the whole question of freight rates in Western Canada. Although no alterations are to be made in the freight rates upon lumber or lumber products, the matter is one which affects the lumber industry closely on account of the bearing which it has upon business conditions in Western Canada and upon the railroads themselves, which are among the largest consumers of lumber. After discussing the evidence and argument in connection with the case, the judgment outlines a comprehensive basis of tolls and a complete rate structure for all railways in Western Canada subject to its jurisdiction.

The territory west of the Great Lakes is divided into three sections. The first is called the Prairie Section, extending from the Great Lakes to the Mountains; the second the Pacific Section, including mainland rail lines in British Columbia; and the third the B. C. Lakes Section, including the inland navigable waters in that Province.

A standard scale of maximum freight rates is fixed for each section. The lowest scale in the West, now known as the Manitoba standard has been amplified to show rates up to two thousand and one hundred miles, and will apply throughout the entire Prairie section and on the British Columbia Lakes, abolishing the higher scale now charged in Saskatchewan and Alberta. What will be known as the Pacific scale is on a somewhat higher basis and will govern in Pacific territory. These changes result in substantial reductions from the present standard maximum scales in Saskatchewan, Alberta, and British Columbia.

Through rates from Eastern to Western Canada are based on those charged from Port Arthur or Fort William. After citing reductions already made by order of the Board in the Regina Rate Case, further reductions are made and a more uniform basis adopted. Examples of the new rates from the Lake Terminals are given below, those to other points being similarly scaled:—

Classes	1	2	3	4	5	6	10
To Winnipeg Old rates ...	86	72	57	42	38	34	20
Winnipeg New rates ...	85	71	56	42	38	32	19
Regina Old rates ...	154	129	102	77	68	59	34
Regina New rates ...	146	122	98	73	65	56	33
Moose Jaw Old rates ...	159	132	106	79	71	61	36
Moose Jaw New rates ...	153	128	102	77	69	60	35
Calgary & Edmonton Old rates	224	186	149	112	102	90	52
Calgary & Edmonton New rates	213	178	142	106	95	85	49
Saskatoon Old rates ...	175	146	116	87	78	68	40
Saskatoon New rates ...	164	137	110	82	74	64	37
Lethbridge Old rates ...	215	179	142	107	96	85	49
Lethbridge New rates ...	201	167	133	100	90	79	46
Nelson & Revelstoke Old rates	303	253	202	158	140	133	73
Nelson & Revelstoke New rates	251	209	167	126	115	104	61

Lumber Freight Rates

Lumber and joiners work from British Columbia to Prairie destinations have been already reduced following the Board's Order in July, 1913. The reference to these in detail is as follows:—

"While this case was in progress, but on complaint standing for some time, the board made an order reducing rates on lumber. The order was appealed; but the issue was settled between the railway company and the shippers. The adjustment having taken place after evidence was given as to lumber rates in the North-west, Mr. Hardweell has worked out the rates situation as left by the agreement referred to. His report on the subject is as follows and in my opinion should be adopted and no further action taken at the present time:—

"By order No. 18738, February 19th, 1913, the board reduced the rates on lumber and other articles carried at the lumber rates from British Columbia shipping points, Manitoba points immediately east of Winnipeg, to and including Molson on the C. P. R., Giroux on the C. N. R., and Hazel on the G. T. P., so as to exceed the rates to Winnipeg by not more than two cents per 100 pounds to the three points named where the difference had been five or six cents. In scaling the new rates so ordered the rates had to be cut down farther east in some cases beyond Kenora.

"As a result of the complaint from the Mountain Lumber Manufacturers' Association, the rates on lumber shingles, etc., from the British Columbian mills to the prairie territory were further reduced by a tariff of the C. P. R. dated July 10th, 1913, and by the G. N. R.'s British Columbian lines dated September 2nd, 1913. The following table which is merely illustrative indicates the extent of the reduction in cents per 100 pounds from Golden, B.C., which has been taken as a

central shipping point, but corresponding decreases were made from Vancouver, Savona, Three Valley, Cranbrook and the other mills.

Lumber Rate Comparisons

Something has been said, although I do not recall it, in the evidence, about the blanketing of the Winnipeg rates back into Saskatchewan, and even into Alberta; but it is obvious that with (say) 36½ cents on lumber from Vancouver to Calgary and 40 cents into Winnipeg, there is not much margin for graduation over the intervening 837 miles. What the company did was to scale the rate upwards for 128 miles from Calgary to Tilley, Alberta, where the 40 cent rate begins and continues to Winnipeg. Similarly the Calgary shingle rate of 38 cents was graduated through 479 miles to Pinkie, Sask., first station west of Regina, where the 50 cent Winnipeg rate commences. A graduation that is progressive could be obtained only by advancing the Winnipeg rates, or by a heavy cut in the Calgary rates, against which no complaint has been registered.

The same situation prevails south of the international boundary; the rates from the Washington coast mills to the Great Northern's Red River points (Fargo and Grand Forks, N.D.). United States carriers still classify cedar lumber with shingles at higher rate. The Great Northern's 50 cents shingle and cedar rate is backed up for 565 miles from Fargo to Vandalia, Mont., and its 40 cent fir lumber rates for 619 miles to Exeter, Mont., compared with the C. P. R.'s 362 and 370 miles, respectively, to Pinkie and Tilley.

As regards the lumber rates from the Lake of the Woods district, from Selkirk, and from the Spruce belt of Northern Manitoba and Saskatchewan, some of Mr. Cowan's comparisons are apt to prove misleading, unless put beside the tariffs themselves, for the reason that in order to secure similar distances from different shipping points, destinations have had to be selected from groups of stations of varying distances, but all taking the same rate. That the grouping of a number of stations at the one rate particularly as the hauls lengthen is necessary, must be obvious, since the stepping up of the rates from station to station would produce rates, which, for the longer hauls, would be prohibitive and useless. Such grouping is a recognized principle in tariff construction everywhere. The lumber rate of 11 cents from Kenora to Portage La Prairie (182 miles), is set against 12½ cents from Selkirk to Killarney (188 miles), thus apparently showing that if one is reasonable the other must be excessive. But the Killarney rate extends farther onto Boissevain, 207 miles. The purpose of this particular exhibit seems to me to show a higher basis of rates for similar distances from Selkirk than from Kenora; yet if we set this Selkirk-Boissevain 207 rate of 12½ cents against the rate of 14 cents for 210 miles from Kenora to Austin, we get a reverse result.

"One more example: At the same page counsel cites 20 cents from Selkirk to Indian Head against 19 cents for nearly the same dis-

tance from Kenora to Russell. But the 20 cent rate from Selkirk operates as far as Regina, 382 miles, while for 383 miles from Kenora to Percival, Sask., the rate is 21½ cents; again a comparison against the exhibit.

"Whether it would be worth while to attempt the removal of these discrepancies only an exhaustive analysis of the tariff and the mileage could show. It appears that during 1913 less than two cars per month were shipped from Selkirk."

A review of the Judgment shows that the whole structure of Western rates, starting from the standard maximum mileage scale, the class tariffs from Lake Superior and Pacific Coast terminals, the class distributing rates, commodity tariffs applying on grain, coal, live stock, cement, fruit, vegetables, brick, sand stone, lumber, dairy products, etc., have been closely inspected and definite decisions given in connection with each.

The Monetary Outlook More Normal

Minister of Finance Sees a Turn in the Tide and Calls for Confidence and Courage

The budget introduced by Hon. W. T. White, Minister of Finance at Ottawa, on April 6th, although containing no alterations in the tariff upon articles in which the lumbering industry is directly interested, was of great importance to the country in general on account of the alterations made upon the duty on agricultural implements, wire rods, building stone, etc.

From the point of view of the lumbering industry, the most interesting feature was a section of the speech delivered by the Minister of Finance in which he referred to economic and industrial conditions in Canada and in the world in general. "There is no doubt," Mr. White said, "that the severe and prolonged financial stringency through which the business world has passed and from which it is only now emerging, marked the culmination of one of those so-called trade cycles well known to economists. Viewing world-wide conditions during the past few years it is apparent that such a cycle has been passed through. We have seen normal money conditions, good times throughout the world, the expansion of enterprises, vast increase in capital expenditure upon railway and other construction in Asia, India, Egypt and in North and South America. Last year there was experienced a shortage of capital in all the financial centres, with constantly increasing interest rates, until after a period of prolonged and severe liquidation and the elimination of vast amounts of inflated values, something like normal money conditions again prevail. The world is now in a period of general, but it is hoped, temporary trade slackening. Without such slackening the financial stringency must have continued. The trade slackening alone could bring it to its appointed end. The conditions I have referred to are world-wide. We are particularly interested in those of Canada. Our production has shown a most gratifying increase in all the great departments of our national activity. In foreign trade this has been our greatest year. What is our present outlook? Bankers and business men unite in the opinion that while it is a time for prudence and caution, it is also a time for confidence and courage. The strength of Canada lies in her vast natural resources. That is the rock upon which our prosperity is soundly based and founded. Any depression, generally speaking, can be but temporary in character until such time as normal money conditions, joined with business confidence, again restores the wonted activity of the nation. While this is so, we must not close our eyes to the fact that we have been passing through a period of considerable inflation. Our railway policy has resulted in the construction of two vast new systems within the past dozen years. Construction upon the main line of these systems is nearing completion. It must, however, be borne in mind that railways are never completed, are always building and rebuilding, always extending their branches and feeders. I do not, therefore, look for any abrupt cessation in connection with our railway construction.

Real Estate Situation

"There has been in real estate throughout Canada a long-expected setback in values of speculative, suburban and business properties. On the other hand, the values of farm and central business and residential city properties are, generally speaking, not only being maintained, but will undoubtedly, with the growth of the Dominion, tend to appreciation. On the whole the readjustment which is going on in real estate conditions throughout Canada is recognized as inevitable and salutary. Commercial prospects for the immediate future seem to me to be encouraging. Conditions will, I think, gradually improve with the returning confidence and easier money. By reason of the Autumn conditions of last year which permitted soil preparation on an unusual scale in all parts of the Dominion the outlook for agricultural production this year is most favorable and we may look forward to increased production in those other great departments, our forests, fisheries and mines.

"Looking back upon the year 1913, it is apparent that the whole world passed through one of those severe financial crises with which

the student of economics is familiar as regularly recurring phenomena in the financial world. The Balkan War, while immediately responsible for the critical conditions which developed, probably disclosed rather than caused the situation. Worldwide expansion in trade, unprecedented demand from all parts of the world upon the loanable capital in the international financial centres, the constantly increasing expenditures upon militarism and armaments, the exhausting wars of the last few years, personal and public extravagance, speculation and price inflation, all co-operated to bring about the financial conditions under review.

Death of Herman H. Cook

The death occurred at Toronto on Sunday April 12th, of Herman Henry Cook, well known to all lumbermen in Ontario on account of his long and intimate connection with the lumbering industry of the province. Mr. Cook was born in Williamsburg, Dundas County, Ont., on April 27th, 1837, so that he had almost completed his 77th year. He came of Loyalist stock. His grandfather, George Cook, at the time of the American Revolution, left the Mohawk Valley of New York and settled in Dundas County, Ont. He had two sons, John and George, of whom the former was for many years a member of the old Parliament of Canada, and the latter—the late Mr. Cook's father—distinguished himself as an officer in the War of 1912. Mr. Cook's mother:

The late Herman Henry Cook, Toronto.

was of German descent, he being the youngest of five sons born in Dundas.

Herman Cook was educated at the Iroquois Grammar School, and in 1858 went into the lumber business in Simcoe County. He secured extensive limits in the Georgian Bay region, and built at Midland the largest sawmill then existing in the Dominion. He accumulated a considerable fortune from this business, and was largely instrumental in the building up of the town. The Midland mill was burned in 1877.

Mr. Cook was president of the Ontario Lumber Company, the corporation which grew out of a business founded by him 56 years ago. He was also one of the syndicate, headed by Sir W. P. Howland, which offered to build the Canadian Pacific Railway in 1880.

The late Mr. Cook was also widely known as a prominent member of the liberal party and sat in several sessions of the Ontario and Dominion parliaments. He first entered politics in 1871, when he unsuccessfully contested the provincial riding of North Simcoe. He was elected by the same constituency for the federal house in the following year. He was re-elected in 1871, defeated in 1878 and returned to the provincial house, where he was elected in 1879 and remained until 1882. Next he was elected to the federal house for East Simcoe in 1882 and occupied this seat until 1891, since when he occupied no further public office.

Mr. Cook's death came quite unexpectedly. He had maintained his usual good health until Monday, April 6th, when he commenced to suffer from a slight ailment. On Friday he seemed to have recovered, but late on Saturday afternoon was seized with apoplexy from which he failed to recover, and passed away in the evening of Sunday, April 12th.

The Reader's Viewpoint on Trade Topics

Retail Trade Expecting a Good Season—Low Water Making Operators Anxious—B. C. Outlook More Hopeful

Articles or letters to the Editor of the Canada Lumberman, dealing with trade conditions, or discussing questions of interest to manufacturers, wholesalers or retailers of lumber are always welcomed by our readers. Here are a few that have been received lately:—

Toronto Outlook Excellent

Editor Canada Lumberman:

Toronto, April 3rd.

We are very pleased indeed to say that our business for the first three months of this year is just equal to last year's record, but much better than 1912. The outlook, so far as Toronto is concerned, is very bright indeed. We understand that architects' offices are filled up with all kinds of work for factories and houses. The housing problem appears to be very much in evidence and, from information gathered, we think that the demand for houses will be even larger than it has ever been in Toronto, while factory business, we think, will be fully equal to that of 1913; at least indications are pointing that way now.

All of our customers have reported that sales are good and that they have not had any trouble in disposing of the houses they erected last year. Even more surprising is the fact that they have been able to get much larger payments than prior to 1913. It looks as though the people have been saving their money instead of putting it in precarious investments, realizing that a good home is about the soundest investment that one can put money into. Further, all our customers are duplicating their business this year, and even more. They state that money is becoming easier and they are able, in most cases, to place their loans to good advantage at about six per cent. Collections have been very slow; they usually are at this time of the year anyway, owing to most of the builders laying out money for the land. The price of lumber, we think, will probably go up a little but not very much. Conditions in the United States have made quite a difference with regard to prices in a certain class of our lumber, but it appears that there is a general improvement all along the line over there. So it means that they will not continue to swamp our market over here, which will mean also that our manufacturers will be able to get a little better margin for their stock. We do not think retail prices will change a great deal except in hemlock, which should come up very materially.

Our requirements for 1914 are based on about the same kind of stock and quantity as we had last year, which, when compared with the general conditions, was a record year with most of the concerns in Toronto.

The outlook for the farmers' trade appears to be very bright from inquiries received, and there was never a brighter outlook than at the present time, and, what is very encouraging is that they all appear to have plenty of money with which to go ahead and do their building. They are also getting out of the old-fashioned idea of simply building a place to live in, as they all want to have the very best stock with the latest ideas and patterns, and it will be up to the retailers of the small towns to wake up to this fact, if they do not want the trade to be taken away from them by the large city manufacturing concerns.—Webb Lumber Company, Limited.

Chatham Trade has bright Appearance

Editor Canada Lumberman:

Chatham, Ont., March 25th.

So far as the woodworking plants are concerned in this district we report as follows:—

During January and the early part of February, trade in our line was somewhat quiet, but during the latter part of February and March to date, things have picked up somewhat, and are giving a much brighter aspect to trade. We feel, from present conditions, and from inquiries which we have had, that trade will be fairly good for the coming season. In our district, plans are being prepared for a number of large buildings, and it seems to us that there will be a number of buildings, such as houses, barns, etc., erected in the surrounding country.

As to collections, in our particular line they have been fairly good, and, although in some cases, as is usual, parties do not pay until they are forced to do so, in nearly every case where payment is forced, we have had no trouble in getting results.

We find that prices range about the same as at this time last year, with probably a few exceptions, where certain classes of stock

are low, and the holders naturally hold out for as high a price as they can possibly get.

We believe that all retail yards in our particular line in this part of the country are pretty well stocked up, and will have enough to supply the demand until the new cut is put on the market.

In this particular district a number of manufacturers have been somewhat quiet, and are running light handed, that is, not having their usual force of employees, but we feel that, in a short time matters will resume their normal condition, and factories will put on their usual force of men.

Farming is one of the most important industries in this part of the province. The farmers are in an excellent condition, as they follow, in nearly every case, mixed farming, that is, not only the growing of grain, but also the raising of horses, cattle, pigs, sheep, etc., and as you know, the markets, especially in stock, have, for some time, been very good. We believe that the farmers are in as good a condition financially as has ever been the case.

Our own trade conditions at the present time do not compare quite favorably with conditions a year ago, as last year we had several large orders from the west, which kept us quite busy, and on account of present conditions in the west, we have not been able to secure the same business this year, and we feel that other lines are affected in the same way.—John Piggott & Sons.

A Good Season Expected at Exeter

Editor Canada Lumberman:

Exeter, Ont., March 26th.

We are pleased to report, from our own standpoint and from the present outlook, that we are going to have a good season. Taking our own local trade, prospects are good and our wholesale trade is coming in as fast as we can handle it. We have at present duplicated a number of our last year's contracts at advanced prices.

We experienced some delay in the settling of accounts, but by looking after them we have received most of the credits, and, as our wholesale terms are thirty days we find no difficulty in collecting them.

Comparing business today with that of last year at this time, we find it a little better and hope to keep this record if at all possible. We are carrying just enough stock to run our business, as we feel we will be better off in the end.

We think the pine markets will be about the same as last year. The hemlock is selling a little lower than last year but we still expect there will be a still slighter decrease as, locally, the mills have more hemlock in the yards than they have had for some time. The Ross-Taylor Company, Limited.

Expecting a Gradual Improvement

Editor Canada Lumberman:

Toronto, Ont., April 2nd.

Up to the present time trade has not been equal to 1912 and 1913, but there is an optimistic feeling among the lumber and planing mill men that business will gradually improve as the season advances, and we anticipate that there will be an average amount of building done during the coming year.

The prices of rough and manufactured materials will be about the same as they were last season. Collections have not been quite as good during the past year as they were in previous years, owing to the stringency in the money market, but conditions are improving and investors expect to be able to obtain money at reasonable rates of interest. This will help to stimulate the building trade.

There is still a good demand for houses of all kinds and the present rentals of house property yield good returns upon the investments. Under these favorable conditions we do not expect very much decline in the volume of building for 1914.—George Rathbone, Ltd.

Evidence of Good Business Ahead

Editor Canada Lumberman:

Toronto, Ont., April 1st.

We are pleased to say that while the volume of business for the first three months of this year is about twenty per cent. less than corresponding months last year, we feel that it is about as good as could be expected, when you take into consideration the late money stringency and the bad weather.

Since money has become a little easier, people intending to build have not yet had their plans completed. There is much evidence, however, of good business ahead.

So far as collections are concerned we have found ours good all

through last year and cannot complain so far this year. This is the case in general, except in one or two instances that did not amount to much.

So far as farmers are concerned, we have found that when they come to place orders for lumber they have their pockets full of money, and would just as soon pay when they order the lumber as after they receive it.

Building Trade Active at Strathroy

Editor Canada Lumberman: Strathroy, Ont., March 31st.

We have every prospect of a good year in trade in this neighborhood. There are quite a number of houses going up in the town and also in the surrounding country. The farmers around Strathroy are, as a rule, a wealthy class and those that have not good buildings on their farms are, I believe, in a condition financially to build. The farmers around here do not build unless they have the money to do so or at least the biggest part of it.

Prices of lumber are practically unchanged but, owing to the low price of yellow pine and also the bringing of hemlock from the United States into Canada hemlock has depreciated at least \$1.00 per 1,000 below what it was last year.—R. W. Nicholson.

Prosperous Season Expected at Welland

Editor Canada Lumberman: Welland, Ont., April 3rd.

Building permits at Welland, up to the present, are ahead of last year, or the year before. Carpenters generally report a prosperous looking season as for building. Dealers of all kinds report that business was about average during the winter, and collections the same. We would consider the farmers in the most thrifty condition they have been for years. There has been ready sale for all their products at good prices. Scarcity of labor for the farms is the serious drawback to the farmer, as most labor seems to want to centre in the towns and cities.—Goodwillie & Son.

A Satisfactory Outlook

Editor Canada Lumberman: Stouffville, Ont., April 2nd.

Business prospects for this season are very good, in fact very much better than we expected them to be. We have done more business this last March than in March, 1913. We may also say that collections are very good, and prices are the same as last year, but cannot just say if an advance will be made or not, as we have no definite prices given by the wholesalers.

On the whole the outlook is satisfactory, and we do not see any reason why we should not do more business than last season.—D. M. Heise & Company.

Good Outlook at Kingston

Editor Canada Lumberman: Kingston, Ont., March 30th.

The outlook for trade this spring is very good, and the volume of business done so far compares favorably with the last few years.

While collections have been a little slow during the last few months, we have every expectation that they will be better after the spring opens up.

The financial standing of our customers, we are pleased to say, is good, and we do not find any trouble in securing settlement of their accounts.—The Frontenac Lumber & Coal Company.

Expecting a Smaller Log Crop

Editor Canada Lumberman: Huntsville, Ont., April 15th.

We believe there are less logs of all description taken out in this district than in former years. Owing to the financial stringency in 1913 many mill owners did not operate in the woods during the fall and winter and, while mills which are operating may have somewhat larger stocks, the total output will be less. The first ten days of January caused a heavy loss to the operator as men and teams were in the bush immediately after Christmas, but could do nothing for want of ice and snow. Since January 10th we have had a very favorable winter for the hauling of logs in Muskoka and Parry Sound and we think the average cost of hauling would be 50c per M. less than usual.

It is a little early yet to write of the probable cut of lumber for the season 1914. The water in the lakes and rivers in this part of Ontario has not been as low for thirty years. The swamps have very little water in them and unless heavy rains fall there is a strong probability that millions of feet of softwood will not reach the mills during 1914. Even if the logs do reach the mills there is no doubt but that the amount saved in hauling will be lost in the drive and an additional cost incurred. Hundreds of drivers are now on the rivers and have been since April 1st. Owing to the backward spring they

cannot do anything but lie around and the drivers cost the lumber company about \$2.75 per day each.

Should we succeed in getting our logs down the streams we will cut this year about seven million feet of lumber.

The stocks will run about as follows:—Hemlock, four million; birch and other hardwoods, two million; spruce and pine, one million.

This is twenty per cent. more than we cut during the season of 1913 and applies equally to different varieties. The stocks in the mill yards in this section are very small and the inquiries are more numerous than for several years. We anticipate an unusually active year.—The Muskoka Wood Manufacturing Company.

A Good Cut of Logs, But Doubtful Driving Outlook

Editor Canada Lumberman: Chapleau, Ont., April 11th.

From the standpoint of getting logs out of the woods, the past winter has been the best that we have ever had. There has been just enough snow to make the work nice, and plenty of frost. Our output of logs and railway ties has been about 50 per cent. greater than any season we have had. The only other company operating in our immediate neighborhood is the Devon Lumber Company and from information we have received, their winter's operations have been equally successful. The timber cut in this section is chiefly Jack pine. Our own output is almost exclusively Jack pine.

Conditions for the drives are not at all favorable so far. There has been very little snow. The ice is very thick both in the lakes and small running creeks and the weather is keeping very, very backward. We are having some very fine bright days, melting the snow a little each day but freezing up at night just hard enough to dry it all up and keep the ice at its usual thickness. Unless we get fine warm rains a little later, it would look to us as though there will be difficulty in getting logs out of the bush.—Austin & Nicholson.

Encouraging Report upon Northern Ontario Conditions

Mr. A. P. Ebert, Huntsville, Ont., formerly of Wiarton, Ont., is covering the northern country for the Manufacturers' Lumber Company, of Stratford, Ont., both in a buying and selling capacity. Mr. Ebert visited Toronto on business recently and reports that logging conditions in Muskoka and Nipissing during the past winter were as good as they have ever been in any previous winter in his memory, so far as the facilities for taking out logs were concerned. The weather in the fall was good for cutting and skidding and when the snow arrived it remained a long time. Moreover, the snow falls were fairly continuous and made excellent sleighing. Weather conditions generally were favorable and operators had good roads all the time for three months.

The outlook in connection with driving operations, according to Mr. Ebert, is encouraging. From the experience of past years, he believes that, during the present season, there will be heavy rains, furnishing plenty of water for the drives. The snow practically all disappeared from the woods during the last week in March and the first week in April, but there was still, during the second week in April, a large amount of ice in the lakes, which could be counted upon to raise the waters in the rivers sufficiently for driving purposes.

The output of logs, as a result of last winter's operations, will probably be fairly extensive. This applies to softwoods, including white pine, Norway pine, hemlock, spruce and balsam. Stocks of hardwoods are not expected to be excessive, but are fairly plentiful. With favorable driving conditions, the quantity of logs taken out, he believes, will approach the output of an average winter of a few years ago.

Mr. Ebert reports that markets are steady, with prices unchanged, although the demand is not quite so good as was expected. The export trade of his company to the United States is fairly active.

Encouragement Increasing in B. C.

Editor Canada Lumberman: Grand Forks, B.C., March 20th.

The outlook for the year 1914 is very encouraging. Many signs point to a better condition in the lumber industry. There is an optimistic spirit taking root in the province of British Columbia. A large number of prominent men, who are in touch with the pulse of the times, feel that the worst of the present depression is over, and that future improvement will be rapid.

Reports from the prairie provinces indicate that large quantities of lumber will be required, and orders are now coming in without having to be pried loose. Firm prices seem to be general in nine-tenths of the manufacturers have decided that they must conserve their timber holdings, by securing a higher price for their product rather than a large volume of business.

All of the manufacturers in the Province have felt a great relief in the final settlement of the forest act. For years the matter of rentals and royalties has been a great worry and a heavy burden, and,

although the final settlement was not entirely satisfactory, it was decided that some settlement was necessary, in order to remove cause for worry and the enormous expense entailed.

There still remains, however, one serious menace to the mountain lumbermen, viz., American competition. The mountain lumbermen have been sorely tried owing to a large percentage of their output being common lumber, and the facility with which western United States manufacturers can absorb the market for common stock when prices fall off in the prairie states. There is no reasonable excuse for the dumping of American low grade stock, as holding the price firm does not mean an increased price to the consumer, principally owing to the large production from the Canadian coast mills. Firm prices, moreover, would give a steadying and more stable effect to the entire industry. The Dominion Government ought to look at this matter in a common sense way, and the fight against dumping will go on until some recognition of this greatest of industries is made.

Although optimism is the word in this glorious province, we do not expect a boom, nor do we want it. We expect that improvement will take place every year, until a high water mark is reached. In consequence, men in charge of large capital consider the present the opportune time to invest in British Columbia.—W. Mark DeCew.

Michigan Output Nearly Average

A despatch from Menominee, Mich., says: While the logging season in upper Michigan permitted getting out nearly as much timber as had been contemplated the same is not true of other large timber fields, and operators are predicting sharp advances in prices as a result. The advances may not come until July or later when the shortage will begin to be felt but it is believed firms with lumber to deliver in the middle of the season will be able nearly to dictate the price of select stock. Operators here have heard that in the Minnesota and Canadian lumber districts the logging season was shortened nearly seven weeks and that the output is much below the normal season. American lumbermen are said to have secured control of the bulk of the cut in Canada for the season just past, which will make it impossible for Canadian lumber to invade the American market to any extent affecting prices unfavorably.

Government Estimate of Ontario Output

According to a report issued by the Ontario Department of Lands, Forests and Mines, the cut in the woods of Ontario during the past winter was as follows:—Pulp wood, 225,250 cords; charcoal wood, 60,000 cords; railway ties, 5,500,000; pine, 350,000,000 feet, board measurement; spruce, 7,500,000 hemlock, 35,000,000; other varieties of timber, 75,000,000; hard wood (maple and birch), 5,000,000. The total figure last year for pine and other varieties was 552,525,898 feet, and this year the figure is 472,500,000 feet, board measurement.

Saginaw Valley lumber dealers are reported to have contracted for nearly 80,000,000 feet of pine in the Georgian Bay district, to be cut for delivery during the coming season of navigation.

Flywheels for Aiding the Motor

Referring to the article by E. E. D., page 41 of the Canada Lumberman of April 1st, it might be of interest to readers for me to state that it is practical to place a flywheel directly on a motor shaft instead of running a separate belt from the line shaft to an independent flywheel. Prof. Goodman, of England, recommends such motor flywheels in certain instances, and it can be easily shown that such design would be more economical than E. E. D.'s arrangement.

The best way to connect such a flywheel to the motor shaft would be by means of a clutch pulley. This would enable the operator to start the motor with the flywheel "off," and after the motor has attained full speed it can be gradually thrown in.

The principal thing to be careful of, in placing a flywheel on a motor shaft, is to see that excessive breaking stress will not be set up in the flywheel rim due to centrifugal force. This force is computed from the formula $C = WV^2/gR$ where C is the centrifugal force in pounds, W is the weight in pounds, V is the velocity in feet per second, $g = 32.16$ and R is the radius in feet. This formula shows that great velocity is a dangerous thing, whereas great radius is an advantage. That is the probable reason why E. E. D. used a separate drive for the flywheel. However, rather than a separate drive, I would have placed the flywheel directly on the line shaft, whose speed is doubtless lower than the speed of the motor, i.e., in revolutions per minute.

Of course, I do not want to say that E. E. D.'s arrangement is wrong, because he may have had the flywheel on hand, and wanted to use it. He therefore made the speed suit the flywheel, which is perfectly proper. But where a new flywheel is to be used, it is unnecessary to run it through a separate drive.

The energy stored in a flywheel is determined from the formula

$E = W V^2/2g$ where E is the energy in foot pounds, W is the weight in pounds, V is the velocity of the flywheel rim in feet per second, and g , as before, equals 32.16. 33,000 foot pounds per minute are equal to one horsepower.

From the two above formulas one should be able to determine the proper flywheel for almost any sawing purpose.

W. F. Schaphorst.

Will Pacific Coast Mills Slaughter Eastern Prices?

Chase, Talbot & Company, 29 Broadway, New York, in their lumber market letter under date of April 1st, say:—The subject mostly discussed in the lumber trade, and that which will soon prove of greatest importance, is the matter of just how conditions are to be adjusted, to admit to eastern markets Pacific Coast lumber products. Unquestionably, Pacific coast lumber and timber will be marketed on the Atlantic in unknown volume after the opening of the Panama Canal, which Colonel Goethals promises to be not later than early in July. The eastern and West Virginia spruce manufacturers, as well as the producers of southern pine lumber and timber, cannot be expected to retire forthwith from the markets they have heretofore enjoyed. Furthermore, a point worthy of serious consideration is the fact that slaughter prices will not and cannot produce increased consumption sufficient to admit of calculation.

Those lumbermen whose opinions are most sought are a unit in the firm conviction that permanency, with the least revolutionary adjustment of the necessary changes in trade conditions, can be accomplished only through organization. We have long since awaited the announcement that important interests on the Pacific coast had combined with some well-established Atlantic coast corporation or corporations, with the object of an intelligent disposition among an established clientele, of a large portion of Pacific coast shipments.

It seems that almost every producer, large and small, is going in "on his own hook," and a great many so-called lumber salesmen are offering the stock. If added emphasis is needed to convince an individual that he is not a salesman, it is to be conscious that he has offered stock to a prospective buyer at a lesser price than the buyer anticipated paying. This fact is true in numerous instances of recent offerings of Pacific coast timber on this market when blanket prices of \$21 per M. delivered on dock this port, have been quoted, with buyer's privilege of making out a dimension specification in sizes and lengths to suit himself. \$4 per M. in excess of this figure would suit the buyer as well and still equal or be under the quotations on competitive stock.

Are the Pacific coast manufacturers not satisfied with the competition they have to meet in Atlantic coast stock, or is it their further object to cut every cent of possible profit out from under each other?

For more than half a century we have fought to maintain and advance the prices of lumber, but now venture to predict with a word of caution, that if the indecisive, haphazard, go-as-you-please methods continue (granting, of course, that any considerable volume of business is transacted) a lower range of prices will prevail in the eastern markets after July 1st than has been known in the last double decade. Co-operation is imperative if the evils forecasted are to be avoided.

Ontario's Large Lumbering Investments

Hon. W. H. Hearst had occasion recently, in explaining the proposed purchase of the Pembroke Lumber Company's limits for \$185,000, to make an interesting reference to the lumbering industry in Ontario. The Department of Lands, Forests and Mines, he said, was already the first on the list of revenue producers. In 1890, the total capital invested in lumber interests in the province amounted to only \$74,000,000. Today the total was \$260,000,000. "There is no other industry or group of industries," he said, "which has as much capital invested in this province or which employs so many men. The nearest approach is the capital invested in fruit stock, which reaches \$133,000,000. Wages paid in the lumbering industry in Ontario during 1913 amounted to \$39,000,000." The value of timber used in Ontario annually amounts to about \$20,000,000. Most of this was cut and manufactured in the province. In addition to being a thriving industry on its own merits, lumbering helped the farming community. Last year over \$2,500,000 worth of farm products went into the lumber camps as supplies. Ontario ranked first among the timber producing provinces of the Dominion, with a total of 32 per cent. of the whole output, and the largest average selling price in the Dominion, namely, \$19 a thousand feet. The area now under timber license was 17,915 square miles. Last year the product of pine had been 254,000,000 feet and the timber dues collected amounted to \$1,759,169. Railway ties alone had brought in \$492,750.

Great care was being taken of the forests. Last year \$325,000 had been expended for fire rangers. The government was also taking steps to equip these rangers with the best fire fighting apparatus.

Death of Frederick Weyerhaeuser

The death occurred at Pasadena, Cal., on April 4th, of Frederick Weyerhaeuser, the multi-millionaire lumberman, of St. Paul, Minn. Mr. Weyerhaeuser was 79 years of age and died of pneumonia resulting from a cold which he contracted on Sunday, March 22nd.

Mr. Weyerhaeuser's connection with the lumbering industry in the United States was more notable probably than that of any other single man and his business career was one of the most interesting in all the annals of lumber history. He was born in Germany in 1834 and the family came to America in 1852. Frederick Weyerhaeuser went west to Rock Island, Ill., and became a retail lumber dealer in 1856. In 1860 he purchased a small sawmill at Rock Island and commenced his career as a manufacturing lumberman. He then began to purchase timber in Wisconsin, a business policy which he continued throughout the rest of his life. Today, throughout the south, the middle north and the far west, there exist a great number of businesses known as "Weyerhaeuser Interests." He was a remarkably successful organizer, although not an actual promoter. His personality was striking and remarkable. Honesty, wisdom and sound judgment were his chief characteristics. He never sought for publicity, and for this reason was probably one of the least known men of wealth of his time. In his private life he was a man of noble Christian character. He lived simply and unostentatiously. His passing away deprives the lumbering industry of the United States of probably its greatest, most successful and most widely respected member.

Death of Henry H. Gibson

Henry H. Gibson, president of the Hardwood Record Company, publishers of the "Hardwood Record," of Chicago, and editor and manager of that periodical, died of heart disease on March 25th, at the age of sixty years. Mr. Gibson had endeared himself to all with whom he came into business or social contact and had established for himself a reputation as an authority upon timber second to none in the United States.

Probably the most notable achievement of Mr. Gibson's business career was the compilation of a remarkable series of articles describing in minute detail the scientific and economic facts regarding every commercial tree of the United States. This work was started in the form of a series of articles which were begun by Mr. Gibson shortly after commencing the publication of "The Hardwood Record." About a year and a half ago the series was compiled in book form under the title of "American Forest Trees," which will stand for all time as a fitting monument to his memory and as one of the highest authorities upon the subject with which it deals.

Valuable Information for Belt Users

A great deal of interesting information regarding leather belting is contained in the latest catalogue, No. 5, issued by the Graton and Knight Manufacturing Company, Worcester, Mass. The catalogue is handsomely published on excellent paper with stiff brown cover and contains many splendid illustrations. Information is included regarding mechanical belting, rules, the care of belting, belting tables, etc., part of which we reproduce, knowing that it will be valuable to many readers.

Our first suggestion, the catalogue says, we believe to be fundamental. It is that the care of the belting shall be entrusted to one man, that he shall be held solely and fully responsible for it, that no repairs or alterations of any sort shall be made nor any dressing be applied except by him or under his immediate direction. No factory is so small and none so large but that this arrangement is a necessity. It is a necessity for a variety of reasons. In the first place it makes some one man responsible for the belting, thereby insuring that it receives attention when needed and not when it is too late, for the "stitch in time" is eminently true in the care of belting, and what is any man's business is no man's business. Secondly, it insures, as far as may be, uniform treatment of the belting, a powerful factor in determining its efficiency and life. Thirdly, it makes possible a full record of the efficiency, repairs, term of service, etc., of the individual belts—a matter of vital economic interest.

It is desirable to place in charge of the belting a man who has been trained in one of the factories where belting is made, and who has had a wide experience in the manufacture and care of belting. When this is not practicable, the man selected for the position should be given a short course of instruction either in a belt factory or under a competent belt mechanic, this instruction to cover the proper care of leather, the making of laps, the taking up of belting, ordinary repairs, etc. Each factory should, of course, be provided with the necessary equipment for doing all ordinary belt work, the outfit required being neither very elaborate nor expensive.

It should be the duty of the belt man to make a careful and systematic inspection of belting at definite, rather frequent intervals,

and keep a record of the same. The inspection should be made to ascertain if any of the following conditions exist:

First—Whether belting is over-dry or saturated with oil.

Second—Whether afflicted with an over-dose of belt dressing.

Third—If any laps have begun to open.

Fourth—Whether the belting is too slack and is slipping unduly.

Fifth—Whether the shafting is in line or if a guide has to be used to keep the belt on the pulleys.

Sixth—Whether the belt is so badly worn as to be in need of early replacement.

How to Remedy Some of the Belt Troubles

When belting appears the least bit dry or harsh, the belt should first be carefully cleaned of surface dirt. This usually may be accomplished by rubbing with a cloth—damping the cloth with kerosene is sometimes of assistance. In bad cases a wooden or metal scraper may be necessary to remove accumulated dirt, but in any event a clean leather surface should be obtained—this should then receive a light coat of dressing on both sides of the belt. This first light application should be allowed to work in thoroughly before more is applied. The applications should be repeated until the leather has that mellow but not greasy feeling characteristic of proper working condition. In cases where belting is exposed to moisture, or where it is accidentally wet, or particularly where the belt works under such conditions that it is first wet and then dry, a little attention in the way of wiping off surface moisture, and applying a light coat of dressing to the still damp belt will work wonders in the way of increasing its life. The sticky belt dressings are usually to be avoided. In rare instances they may be immediately useful, but if used to any extent they stick the belt to the pulley so tightly that the grain is pulled off the belt, or, working into the leather, they rot it and shorten its life.

By keeping simple records and following the foregoing instructions for a period of three years, a large saving in the annual belting expense has been effected, in some instances as high as 50 per cent. This included only the first cost of the belting, labor and material used. Were it possible to estimate the increased output of machines due to more continuous operation without breakdowns, the results would be still more remarkable.

In order to assist belt users in effecting savings of this nature by the use of the best quality of belts, the Graton & Knight Manufacturing Company have had prepared in their engineering department several belt record systems to meet different requirements. These systems vary according to the size and kind of factory, number of parts used, etc., and by their use every plant, large or small, will be greatly benefited.

Avoid Oils, Greases, etc.

On the subject of care of leather belts, the catalogue says:—Too much grease is injurious to leather. Mineral oils in particular rot leather very rapidly, and where belting is liable to become soaked with oil, mechanical means should be taken to keep the oil from the belt. Where this is impossible the belt should be removed from time to time and the oil extracted with some solvent such as naphtha or carbon tetrachloride. Packing the belt in dry sawdust or shavings or some similar absorbent material will sometimes answer the purpose. If it is not possible to remove the belt, wiping it while on the pulleys with a dry cloth or waste or some absorbent material will help. Machine oil, besides its tendency to rot leather when present in excess, gives a bad frictional surface, leading to excessive slipping. An excess of oil also has a tendency to injure the sticking qualities of the ordinary cements used in making belting. Frequently, from this or other causes, laps start up at the points, a result sometimes due to running belting in the wrong direction. All belting should be run so that the point of the lap on the outside surface of the belt points opposite to the direction in which the belting is run. To whatever cause the trouble may be due it should be given early attention.

In the case of oily belts it will be necessary to degrease the parts to be joined together or the cement will not stick satisfactorily. Do not think you are repairing the trouble if you drive a string of tacks through the joint. This is simply making a bad matter worse, for the leather will probably break where you have applied the tacks. There is a right and a wrong way of repairing laps as well as of lapping the ends of a belt together when first installed, and the quickest and easiest way is by no means the most economical in the end. It is very easy to drive a heavy cast iron belt fastener into a piece of leather, but it is just as well, before doing so, to think how much you will weaken the belt at that point, and how much service you will lose from your machine by the jump of the belt every time that chunk of metal goes around the pulley. The most satisfactory method of jointing belting is by making a cemented lap or joint. This is a surprisingly simple process once a man knows how; and given the man and the training advised, there is no reason why nearly every belt in a factory should not be joined together in this way.

The Commercial Importance of Spruce

Canada's Most Important Timber Tree Providing Over Two Billion Board Feet of Logs Annually—Fourth of a Series of Articles on Canadian Woods

By R. G. Lewis

Sitka Spruce with Buttressed Base.

If we consider the quantities of spruce sawn into lumber; consumed for pulp manufacture; exported as raw pulpwood; purchased for railway ties and poles; manufactured into cooperage stock; and used in the round in mining operations we have a total of over two billion board feet of spruce logs removed from the forests of Canada in a single year. That this is a conservative estimate can be readily seen by the fact that the quantities of spruce used for firewood, fencing, piles and rough railway and other construction work are not included in the above figures. This would indicate clearly that spruce is Canada's most important timber tree.

The use of spruce for pulp manufacture in Canada in the last few years has increased enormously with the rapid growth of this industry. The wood has the long, tough, colourless fibres which are necessary for a good pulpwood and in addition is remarkably free from resin for a coniferous tree. These qualities will probably insure it a place in pulp manufacture in spite of the increasing use of substitute woods.

Spruce is not well suited for mining timbers as it is not durable in damp situations. This lack of durability also detracts from its value for railway ties and for poles. An economical preservative treatment which would protect spruce ties, poles, and props from decay throughout their mechanical life would add considerably to their value for these purposes.

The use of spruce for lumber has increased greatly in the last few years, with the increased scarcity of white pine; a wood which spruce closely resembles. For rough dimension lumber spruce has practically taken the place of white pine in the Canadian lumber market.

Five Distinct Species of Spruce

There are five distinct species of this tree in Canada all of which are used commercially.

White spruce (*Picea canadensis*) is probably the most important in point of quantity, as it is found in every province of the Dominion. It is not common in Nova Scotia, but is the most important timber tree in Quebec, Ontario and the three prairie provinces. It is undoubtedly rare in British Columbia.

The greatest quantity of white spruce lumber is sawn in Quebec and the total for 1912 for this species in Canada was probably in the neighborhood of 1,050,000,000 feet.

The wood of white spruce is light in weight and colour. It is soft, stiff, moderately strong, and tough. It has a fine even straight grain, is easy to work and hard to split. The lumber seasons well, holds nails well, is tasteless, odorless and non-resinous. It resembles the soft pines in many details, but is lighter in colour, has a finer grain and is less durable than white pine. The wood of white spruce is the lightest in colour of all the spruces.

Red spruce (*Picea rubra*) is the most valuable of all the eastern species on account of its fine texture and satiny lustre. The wood is very similar to white spruce, but is darker in colour with a distinct reddish tinge and is usually considered to be stronger. This tree is found in Nova Scotia, New Brunswick, Prince Edward Island, Quebec and Ontario.

The fine grain of this wood is due to its slow growth. It has been said that it takes this tree from two hundred and fifty to three hundred and fifty years to reach an average diameter of thirty inches.

In Eastern Canada the red spruce is seldom recognized by the lumberman and many of them deny its existence. The tree is often confused with black spruce (*Picea mariana*) and sometimes even with white spruce (*Picea canadensis*) although the three species are easily distinguished by the size and shape of their flowers and cones.

Canada cut approximately 200,000,000 feet of red spruce in 1912 compared to 860,000,000 feet for the United States.

Black spruce (*Picea mariana*) is a distinctly northern tree and with the tamarack is found further north than any of the other tree

species of America. This tree probably reaches its greatest development in Northern Manitoba and North-western Ontario.

As a general rule, black spruce does not reach a sufficient size to be important as a lumber tree. The tree is confined to poor soils and cold damp situations and grows very slowly. Its lumber is consequently stronger than most other spruces on account of this slow growth. The wood is usually harder than that of the other spruces and is considered to be the most durable species.

In the coal mining districts of Nova Scotia, where spruce and fir are the only mining timbers available, specifications for pit booms call for black spruce exclusively. Props and pit ties may be of white or red spruce or of balsam fir. Experience has shown that booms of this material outlast those of the other spruces when placed in damp situations.

In Canada the cut of black spruce lumber would approximate 40,000,000 feet a year and that of the United States would be less than 25,000,000 feet.

Sitka spruce (*Picea sitchensis*) also called tideland spruce is the most important spruce species of British Columbia. In this province the tree is confined to the western slopes of the Coast range. It reaches its highest development on delta lands on the coast of Washington and Oregon. It usually grows to a height of a hundred feet and a diameter of three to four feet above the stump, and is noted for its heavily buttressed base. The wood of Sitka spruce is the softest of that of the spruces and is also the lightest in weight and the darkest in colour, being a pale brown with a faint reddish tinge. It splits easily and has a satiny lustre similar to that of red spruce but is otherwise very similar in its general characteristics to the other spruce species. Being the largest of the spruces its wood is most valuable on account of the large dimensions in which it can be obtained and the large percentage of clear lumber it produces. The tree grows rapidly as is indicated by its soft lumber and is a very long-lived species. Trees have been found from 4-6 feet in diameter and from 150-180 feet in height which were from 450 to 750 years old.

Engelmann spruce (*Picea Engelmanni*) is the typical Rocky Mountain spruce of Alberta and British Columbia although its range spreads out to the southward and includes the interior mountain ranges as far south as New Mexico and Arizona. In Canada this tree is found on the east slope of the Rockies in the Yukon Territory and spreads into British Columbia south of the Peace River although it is not found beyond the eastern slopes of the Coast Range. It reaches its highest development in south-eastern British Columbia where trees a hundred and fifty feet in height and 4-5 feet in diameter are quite common.

The wood is light, soft, fine and straight grained and is a light yellowish colour with a faint reddish brown tinge. It is sawn in considerable quantities in the Mountain mills and sold under the name of Mountain spruce.

As a general rule this tree does not produce lumber of as large dimensions as Sitka spruce although its percentage of clear grades is probably quite as high. The annual cut of this material is probably in the neighborhood of 50,000,000 feet in British Columbia as compared to 33,000,000 feet in the Western States.

The lumber of these five species is usually sold simply as spruce and where more than one species is cut in a district the lumber of each species is not kept separate.

Spruce As a Building Material

Spruce lumber in Canada is used in greatest quantities by the manufacturers of building material. It is popular for this purpose not only because of its cheapness and abundance and the fact that it can be obtained in all dimensions but because of its physical qualities. The most important of these qualities are its softness, lightness and uniform structure which produce a lumber that takes paint well, is easily worked and which "stands up well" or holds its shape with the minimum of shrinking, warping or swelling.

In Ontario, where white spruce forms a greater part of the spruce lumber on the market, this wood comes third on the list of woods used for the manufacture of sash, doors and house trim, forming 10 per cent. of all the wood used in this industry. The greatest quantities of spruce are used for siding, flooring and roof sheathing. Spruce is used also for framing and interior finish but hemlock makes a stronger frame and pine is more suitable for decorative work and for sash and doors.

In the Maritime Provinces where pine and hemlock are not so abundant, spruce is the most important wood used for building material and forms 60 per cent. of the total quantity used. This lumber

would be chiefly red spruce. In Manitoba and the Prairie provinces spruce is the most important building material and the lumber used is white and black spruce only.

Spruce is used in the manufacture of boxes and for crating material to an enormous extent in Canada. The wood has particular qualities which fit it for this purpose. It is tough, light and strong, holds nails well and is odorless, tasteless and non-resinous. Its light color makes it attractive in appearance. Its lack of taste and odor fit it for food containers and its toughness recommends it for crating.

Economical Use in Box Factories

Many of the larger, more complete, sawmills have box factories in connection, which utilize slabs, edgings, trimmings and cull material for box shooks. This practice effects an enormous saving in raw material and results in increased profits to the mill owners. Many large concerns are engaged in manufacturing box shooks exclusively, sawing their own logs and shipping the finished product in the knocked-down form ready to be assembled by the final users. Many firms located in the larger cities buy finished lumber or box shooks and merely assemble these for the users.

The use of spruce for cooperage is steadily increasing as the local supply of elm and oak decreases. In the Maritime Provinces spruce is the most important wood for this purpose and it seems to be a fairly satisfactory substitute for elm. It is specially valuable for barrels to contain dry fish, fruit and other food stuffs. Large quantities of tight cooperage stock are also manufactured. The wood is valued in this industry for its strength in comparison to weight, and its toughness and lack of taste or odor.

In the manufacture of railway rolling stock, spruce is used only because it is a cheap material, with the requisite strength and toughness for siding and flooring in freight cars. It is used for lining refrigerator cars because of its lack of odor.

There are many purposes for which spruce lumber is used which do not depend on any of its finer qualities but merely on the fact that it is cheap, light in weight and fairly strong and tough. These uses, in addition to those already mentioned, include the use of this wood in the manufacture of boats, vehicles and implements, furniture, fixtures, machinery framework, coffins, shells, and foundry flasks.

In many instances spruce is preferred to other woods on account of its lack of taste and odor. Its uses in this connection, in addition to boxes, cooperage and refrigerator cars, include doors and lining of refrigerators and cold storages, kitchen tables and cabinets, silos, wooden water pipes, woodenware which comes into contact with food such as butter working tools, bread boards, meat boards, etc.

When the spruce grows in close stands in the forest, it develops a long, slender, tapering bole, free from large branches for the greater part of its length. This habit of growth together with the lightness and toughness of the wood, produces an ideal material for the spars of vessels. In addition to the large quantities of spruce lumber used in building the hulls, many selected trees are felled and made into masts, yards, booms and bowsprits.

Spruce can be used in large dimensions with greater safety than most woods. Not only is the wood remarkably free from defects, but these defects, when present, show in the surface and there is little danger of a well selected spar failing through some hidden defect.

Well Adapted for Special Uses

This same quality together with an unusually straight grain makes spruce a favorite wood for the manufacture of cars and paddles. The long, light, carefully proportioned and balanced sculls used in racing boats are made exclusively of spruce. No other wood has the lightness and strength together with the uniform structure and straight even grain. Manufacturers of these products in the east have great difficulty in obtaining stock of sufficient size for the best class of sculls and many of them import selected sticks of Sitka spruce and Engelmann spruce from the Pacific Coast for this purpose. As a general rule two sculls can be made from a well selected 3 in. x 19 in. plank, 14 ft. long.

One of the most distinct characteristics of spruce wood and one which it does not share with any other wood to an equal extent, is its resonance. For the manufacture of sounding-boards in pianos, resonance is an essential quality and spruce is usually demanded for this purpose. Its quality of prolonging and increasing sound vibrations is a remarkable one and is due chiefly to its uniform structure. Trees growing under unfavorable conditions whose annual growth rings are narrow, produce the best quality of wood. Consequently lumber from high altitudes is in greatest demand. Wide stock is imperative and old trees of large size are greatly sought for. The wood must be carefully selected, seasoned and manufactured and the percentage of waste is very high. For many years the red spruce of the Atlantic Coast was preferred by organ and piano manufacturers on account of its fine, even grain but Sitka and Engelmann spruce from the Pacific Coast are now used in greatest quantities as they can be obtained in greatest dimensions free from defects.

Organ pipes, bellows, swell-boxes, wind-chests and ribs are also made preferably of spruce as are the ribs of pianos and such small instruments as guitars, mandoline, zithers, etc.

In addition to these more important uses, spruce is purchased in small quantities by the manufacturers or many other commodities. Often it is used only because it is cheap and abundant and often because its use has become a habit. Some of these uses are peculiar and worthy of mention.

Spruce has been reported, both in Canada and the United States for the manufacture of bobbins, camera boxes, vent plugs, faucets, and bungs for barrels, flag-staffs, vaulting-poles, Indian clubs, windmill slats, ladders, scales, wash-boards, cross-arms, automobile flooring, excelsior and wood-wool.

It is sometimes used for core-stock for veneered products and for the rims of wooden pulleys, as it glues up well and holds its shape. Spruce makes excellent veneer that does not split on drying and can be used to advantage for baskets, berry boxes and plates as well as for built-up veneered products.

Framework for Aeroplanes

One of the most exacting uses to which this wood is put is in the manufacture of certain parts of the framework of aeroplanes. Toughness, lightness and straight grain can be obtained in other woods but none of these are as free from hidden defects as spruce. When the life of the aviator depends on the reliability of each separate part of the flying machine it is necessary for the designer to select materials whose qualities are well understood.

The "struts" or upright posts which separate the planes in a bi-plane and those parts of the "fuselage" or body framework of a mono-plane which are in compression are always made of this wood. The bent ribs which give the mathematical exactness to the curve of the planes themselves, are made of thin strips of straight-grained spruce, glued together to insure permanency of form and to give the greatest stiffness possible in relation to size and weight. The beams or sills which run the entire length of the machine are made of single pieces of spruce in which the grain must run absolutely straight for the entire length of the piece; often sixteen feet or more. Other woods are used in aeroplane construction but spruce is practically the only wood used for the framework.

Spruce will grow in almost any kind of soil and under varied conditions and has long been a favorite tree for reforestation. Some of the species are of very rapid growth under favorable conditions while others take many years to reach maturity. Precise figures of the growth rates would be of little value in a general description of this nature, but it might be safely said that spruce does not grow as rapidly as white pine or, in fact, any of the native pines of Canada. It is particularly well adapted for planting in close stands as it will endure the maximum quantity of side-shading. Young trees will endure over-shading for fifty years or more, under stands of other species and when released by their removal, will grow rapidly and reach maturity.

Lumber Company Loses Law Suit

Judgment was recently given by the Court of Appeal in the case of the Northern Crown Bank of Winnipeg against the Great West Lumber Company. The decision was in favor of the bank. The case involved a sum of approximately \$600,000. The action arose through a denial on the part of the lumber company of its liabilities to the bank which had made large advances to the company. The company alleged that when these advances reached a certain sum, the bank took an active part in the conducting of the business, to such an extent that the lumber company was relieved of responsibility for any loss which might have been incurred. At the first trial, Chief Justice Harvey decided in favor of the lumber company.

Barbados Market Report

S. P. Mussen, Son & Company, Barbados, report under date of March 27th as follows:—Lumberstuffs.—White pine.—There have been no arrivals in this class of lumber during the fortnight, but dealers' yards are fully stocked. Spruce.—No receipts, but we have sold a cargo to arrive, which is now about due. Pitch pine.—No receipts, but the cargo ex "Ethel Clarke" mentioned in our last, keeps the market amply supplied. Shingles.—There have been no receipts of either Gaspé or cedar laying during the fortnight.

Five Thousand Facts About Canada

The 1914 edition of "5,000 Facts About Canada," compiled by Frank Yeigh and published by the Canadian Facts Publishing Company, 588 Huron Street, Toronto, contains in concise and very interesting form a remarkably varied assortment of important information regarding Canada and its many industries. The book is, in fact, a mine of information and contains all the essential facts relating to Canada's progress during the year 1913. Copies may be had from the above address for 25c each.

Electric Drive in the Planing Mill

Advantages of Separate Motors Clearly Demonstrated—Rehandling of Stock Reduced to a Minimum—Equipment of Most Modern Type—Description of Operation

By E. J. Barry, Assoc. A.I.E.E.*

The inherent advantages of electric drive are well illustrated in the latest addition to the list of planing mills of the Pacific Coast. In June of last year, the St. Paul & Tacoma Lumber Company of Tacoma, Washington, placed in service their new planing mill, equipped with the latest and best devices for the production of finished lumber. During the previous year, their old planing mill and one of the sawmills were destroyed by fire, and it was then planned to build the best mill on the Coast. Whether this laudable ambition has been realized is left for others to judge; but there is no question that the mill is a model of its kind, and a striking example of modern design and practice. As may be seen from the illustrations, the mill is solidly built and well equipped with sprinkler system and standpipes, as fire protection. The interior is coated with whitewash as a further preventive, while the extensive blower system prevents the accumulation of shavings and sawdust, which if allowed to remain constitute a fire risk.

Each machine is driven by a separate motor, the absence of line shafting being highly appreciated. The total output of the planing mill is 300,000 feet every day of ten hours, and the total connected load amounts to 1,192 horse-power.

High Efficiency of Equipment

As money is made or lost in the re-handling of lumber, every effort is directed to reduce this factor to a minimum. The fast feed planers are equipped with feed tables which operate much on the principle of a repeating rifle. The table is loaded with boards which are shot through the planer as fast as the machinery will operate, that is to say, up to a speed of 250 ft. per minute.

The paving block machine is the first on entering from the south end of the mill, and is driven by a 75 h.p. motor. There are 15 saws of 25-in. diameter mounted on the arbor, spaced 4 in. apart. A conveyor driven by the same motor carries the block material past the saws, which cut them into the well known shape of paving blocks. The blocks drop into a conveyor which loads steel cages mounted on wheels, and the cages are then transferred by electric locomotives to the creosoting plant, and after treatment there, are ready for shipment. The capacity of this machine per day is from 75,000 to 100,000 blocks.

The next machine is a 20 by 16 in. Berlin surfacer, driven by a 1,200 r.p.m. 50 h.p. motor. Heavy timbers for building construction are handled by this machine. Next to the surfacer is a rip saw driven by a 15 h.p. motor. This saw gets through a lot of work in a day.

*Mr. Barry designed and installed the entire electrical equipment for the St. Paul and Tacoma Lumber Co., which is described in this article.

How Individual Motor Drive in a Large Planing Mill has provided maximum efficiency at minimum operating expense.

A Fay & Egan gatling gun moulder is the next in line, turning out mouldings. 20 h.p. is required for this operation.

Next comes a No. 108 Berlin Moulder for heavier material taking a motor of 35 h.p.

After the moulder is a 64 in. re-saw, driven by a 50 h.p. motor. This machine is kept very busy.

The next machine is a combined re-saw and matcher, as shown in illustration, which has given excellent service. Here, as in all industries where it is possible to combine two operations in one, the cost of production is cheapened to that extent. Various kinds of lumber call for surfacing on one side only, so the material is planed top and bottom, and resawn as it passes out of the machine. A 50 h.p. motor is used for the matcher and a like one for the re-saw. The motor for the planer is direct connected, but a silent chain drive is used on the re-saw to allow a 2½-in. movement of the heads. The automatic electric release of each driving motor is so connected that a mishap to one will throw the other out, thus obviating the danger of the planer driving the lumber at full speed against the saw when its motor has stopped.

Two 15 by 6 Berlin planers follow, driven by 75 h.p., 1,200 r.p.m. motors.

Next in line is a 9 by 6 Berlin machine driven by a 50 h.p. motor, and following respectively, a Fay & Egan planer and an S. A. Woods planer, both 15 by 6 and driven by 50 h.p. motors of 1,200 r.p.m.

Attached to each of these planers and driven by 15 h.p. motors, are profilers to cut various grooves and beadings in the finished lumber.

As the lumber passes through the planers it is trimmed to the proper lengths by small swing saws, of which there are 16, driven by individual motors of three horse-power each. These are shown in the illustration.

The cuttings from the trim saws drop down a chute into a motor driven conveyor, which carries them to a hopper outside the mill, for disposal. The lumber, cut to proper dimensions, drops on a moving belt conveyor, and is taken to the grading table. After sorting, it is loaded on cars ready for rail or water shipment.

The blower system is driven by two 150 h.p. motors, and a suction pipe is brought to every outlet, for the disposal of refuse.

The Wiring System

The wiring throughout is contained in galvanized iron conduit, for both power and lighting circuits, with the object of securing fire-proof and mechanically and electrically sound construction. A 1,000 kilowatt General Electric Curtis turbo-generator supplies energy at a pressure of 440 volts for power. For lighting, the pressure is stepped

Combined Resaw and Matcher Electrically Driven

Trim Saws and Lumber Conveyors with Electric Drive

up by transformers to 2,200 volts for transmission and is stepped down to a working pressure of 220/110 at the building.

The power service is brought in at the south end of the mill, and consists of four 350,000 c.m. rubber covered cables arranged in multiple; twelve cables in all. The conduit is carried under the floor wherever practicable, and care was taken to install it with a view to good appearance as well as utility.

The main feeders supply two panel cabinets designed by the writer, and built by Evans Dickson Company of Tacoma.

The bus bars are accessible from the rear, leaving the fuse mountings in the front of the panels, clear of cables. In operation, the doors at front and rear of cabinets are kept closed, and the insides of doors are lined with asbestos over the steel to prevent arcing trouble, in case a fuse should be jarred loose by any means. The fuses are readily accessible to cut a circuit out of service, should such be necessary, without in any way interfering with the operation of other machines.

Overload relays have been placed on each motor as protection against overloads, and when properly installed and given a reasonable amount of attention, they form an ideal method of protection. One can tell at a glance if a relay has been tampered with, but a re-filled fuse of heavy capacity may give fancied security. The annoyance of a motor continually cutting out will soon cause the operator to report to the proper quarter, and so give the opportunity to prevent damage to the machine as well as the motor. Then the temptation to replace a fuse with a nail or a handy strip of metal, is well known to anyone experienced in industrial power work.

Ingenious System of Signals

A planing mill in operation is not the quietest place in the world, and a signal system has been devised to insure that the machines receive attention when required. When an operator wishes to call a machinist to make repairs or alterations, he steps to the nearest post and switches on a red light, showing on the glass the number of his machine. He then pulls the cord of a whistle operated by compressed air, and the machinist has only to look at the signal light to discover where he is wanted.

The lighting throughout is by means of metallic filament lamps of from 60 to 250 watt capacity each, and the control is from the filing room located above the planing mill floor.

Individual lights and pilot lights are supplied from a separate distribution board, while the general lighting is controlled by 6-50 ampere triple pole switches, controlling lighting panels distributed through the mill.

The lighting system is entirely separate from the power, so that an accident to the power feeders would not leave the mill in darkness. This also ensures a better and more steady voltage, at the lamps.

At all points electricity has proven its efficiency in planing mill work, particularly in the manner in which it is possible to keep the speed of production at the desired level, especially where individual drive is used. A machine at any point may be started up without the necessity of running the cumbersome transmission line shafting and belts, which engine drive involves. Electricity is clean and changes and extensions are easy to make.

President E. G. Griggs of the St. Paul & Tacoma Company has long been an advocate of electric drive, and the electrical profession

has reason to appreciate the efforts of such progressive men, who are willing to take the initiative in pioneering, in what is, comparatively speaking, a new field for the utilization of electrical energy.

Quebec to Open New Pulpwood Areas

Quebec, April 3.—Departing from the rule which has been observed for eight years, the Quebec Government has decided to open new districts to lumber and pulp industries and will auction off limits in the Abitibi and Lake St. John districts during the months of August and October. In the Lake St. John region the territory to be opened is north of the lake and in the basin of the Mistassini and Rat Rivers. In the Abitibi it is situated south of the Transcontinental, but on the north slope in the basin which empties into James Bay. This tract is traversed by the Poisson, Blanc, Harricana, and Belle rivers. Both limits have been most carefully surveyed by the Forestry Service. These concessions will call for the development of the water powers in the districts and will carry the obligation to construct pulp mills of a specified capacity within three years. The delay between now and August is to allow opportunity for exploration and permit of advertising the proposed auction, not only in Canada but also in the United States, Great Britain and France, as the government wishes to attract the attention of foreign capitalists to the great natural resources of the province. The government has appointed five official guides to further the interests of colonization.

Reasons for Free Entry of Novelty Siding into U.S.

A report was recently published in the Canada Lumberman, of the decision of the United States Treasury Board in regard to the duty upon "novelty siding" entering that country from Canada. It will be recalled that after a reference to the Treasury Board a decision was given in favor of admitting this material free of duty. The decision of the Board in connection with this matter states that the evidence is that this lumber, ranging from 10 ft. to 16 ft. in length, 6 in. in width, and 1 in. in thickness is reduced to its present form by being put through a planer, the board being fed through the planer by pressure rolls crowding it against knives. Smoothing of the sides and edges as well as the coving or concaving effect are all produced by planing, the knives being adjusted so as to produce the desired results. These boards are known generally as "novelty siding" and sometimes as "clapboards" or "fancy clapboards." The witnesses, who appeared to be men of extended experience in the manufacturing and selling of lumber, practically united in saying that planed lumber, as known to the trade, embraced all forms of lumber made through the use of a planer or a planer and matcher. Such lumber, very obviously had not lost its identity as lumber, by being manufactured into an article with a distinct and new name. The most that might be said was that these boards were "lumber manufactured" which was altogether different from "manufactures of lumber." In a former case, *Unittd Stated v. Dudley*, it had been held that boards and planks, planed on one side and tongued and grooved and adapted for flooring, ceiling and sheathing were nevertheless, not manufactures of wood. The Treasury Board stated also that they were satisfied that it was the purpose of Congress, in the last revision of the tariff, to place all kinds of lumber, regardless of how it had been treated, so long as it had not lost its identity as lumber, on the free list.

Blow Pipe System Showing Motor

The Uses and Costs of Balsam Fir

Market Greatly Widened by Rapid Expansion in Demand for Spruce—Stumpage Prices and Logging Costs

A bulletin upon balsam fir, prepared by Raphael Zon has been published by the United States Forest Service. The bulletin is the result of study carried on during two summers in the Adirondacks in Maine, and throughout the whole of the tree's commercial range. In the introduction the bulletin says:—

The enormous expansion of the pulp industry in this country during the last two decades, with its present annual demand for not less than three and a quarter million cords of coniferous wood, has stimulated the use of balsam fir, which but a few years ago was considered of little value. With the increase in the price of spruce for pulpwood, balsam fir has begun to take its place for rough lumber, laths, shingles, and box shooks. The cutting of balsam fir to any extent for pulp or lumber began only about twenty years ago, as the more valuable species of the northern forests became scarce and as its suitability for many purposes for which only white pine or spruce were originally used became recognized.

Balsam fir, though in general inferior to white pine and red spruce, is now a tree of considerable economic importance in the northeastern forests. The uses for which balsam fir is suited and the appearance of barked wood, especially after it has remained for any length of time in water, are so much like those of spruce that it is commonly sold in mixture with and under the name of spruce, because of a lingering prejudice against balsam fir among pulp manufacturers and lumbermen. This prejudice, formed at the time of still abundant supplies of spruce and white pine, is based partly on the actual inferiority of balsam fir to those species and partly on insufficient familiarity with the wood.

The heaviest commercial stand of balsam fir are found in Canada, in Quebec and Ontario. On the Cape Breton Islands, balsam fir forms a solid forest, with not over 15 per cent. of spruce and a small admixture of paper birch, covering a plateau of 1,000 square miles. It is estimated to compose more than 50 per cent. of the forest, 150,000 square miles in extent, on the southern slope of the Laurentian shield, south of the height of land. In the United States balsam fir is found in commercial quantities in most of Maine, the northern parts of New Hampshire, Vermont, New York, and to some extent also in the swamps of northern Wisconsin, northern Michigan, and Minnesota, or, in all, over an area of approximately 35,000 square miles.

Dealing with the use of balsam fir as lumber, the bulletin says: The increased demand for spruce by pulp men, who were able to pay higher prices for it than the lumbermen, compelled the latter to turn their attention to hemlock and balsam. Hemlock enters now more and more into building operations, supplanting spruce; while balsam fir, not being as strong as spruce, is relegated to uses for which strength is not a prime requirement. The total cut of balsam fir for lumber in 1909 was reported as 108,702,000 board feet.

Balsam fir is softer and more brittle than spruce; it decays rapidly in the ground, and when green does not hold nails well; but being light and tasteless it makes a very desirable box material, especially for foodstuffs. It is extensively used for cheese-box headings, staves for fish and sugar barrels, sardine cases, butter boxes, and the like. It is easily worked, and is well adapted for molding, novelty, bevel, and drop siding. It is of straighter grain than spruce, and in seasoning is less subject to warping and twisting, which makes it the better of the two woods for fence boards, small joists, planing, scantling, laths, and shingles. Its white color often makes it desirable for house finishing, and some consider it superior to spruce for violins. It saws easier, dries quicker, and is claimed to hold paint better than spruce. It has also been found to be suitable for rough lumber, flooring, ceiling, studding, crating, furniture, sheathing, children's carriages, toys, small frames, matches, square timber, excelsior, etc. In the form of box boards it yields about ten per cent. of material more to the cord than does spruce.

In 59 out of 141 sawmills which answered the circular letter, the use of balsam fir in the past few years has not perceptibly increased. Thirty-four mills now use from 10 to 40 per cent. more than formerly, 30 mills from 40 to 75 per cent. more, 13 mills from 75 to 100 per cent., while two mills use four times as much as they used three or four years ago. Only three mills report that the amount of balsam used by them has decreased.

Balsam Fir Pulpwood

Balsam fir finds its greatest economic importance as a pulpwood. There is a close connection between the extent of the available supplies of spruce in a State and the amount of balsam fir used in the manufacture of pulp and paper. As long as there is a plentiful supply of the former, the use of balsam fir is naturally restricted. But where the demand for pulpwood is greater than the available supply of spruce, balsam is the accepted substitute. Out of about 2,220,000

cords of domestic coniferous wood used in the United States by the pulp industry in 1910, 6 per cent., or 132,362 cords (about 66,000,000 board feet), was balsam fir.

The principal objection to the use of large amounts of balsam fir in the ground-pulp process is said to be on account of the pitch that covers the felts and cylinder faces. It is admitted by nearly all pulp and paper men that from 10 to 25 per cent. of balsam can be used in ground pulp without lowering the grade of the paper produced. A few go even so far as to claim that a larger admixture of balsam fir—from 20 to 25 per cent.—is of advantage, in that it makes the pulp "free"; that is, separates the spruce fibers during the manufacturing process and in this way allows the water to be easily drawn from the sheet. Still others claim that a satisfactory ground wood pulp can be made almost entirely of balsam. In chemical pulp, because of the acids dissolving the pitch any amount of balsam can be used, though some claim that paper made of pulp containing a large admixture of balsam lacks strength, snap, and character. The pitch gives most trouble in freshly cut balsam, while in wood soaked in water over a season the amount is so small that it need not be taken into account. Some of the larger mills claim that after balsam fir has remained in the pond for one year any amount of it can be used.

Difficulties in Logging

Compared with spruce, balsam fir is difficult and expensive to log. It is small, and therefore a gang working in a pure stand of balsam can not cut in a day as much as when working in spruce. When green, it is heavier than spruce and therefore harder to snake out and handle, especially in summer in the swamps. It yields a greater per cent. of cull, and in many cases the presence of rot can not be detected until the tree has been felled and cut into. It floats heavily, and many logs become water-soaked and sink, making the driving very difficult. To offset these disadvantages, and to make the use of balsam more profitable, its stumpage price should always be lower than that of spruce.

Stumpage Prices and Logging Costs

The ruling price in the Adirondacks for cutting and skidding pulpwood (long logs) is about \$1.50 per cord. In this price the cutting of roads is included. The extra cost of resawing the long logs into 4-foot lengths and piling them along the log road is ordinarily 40 cents per cord, and requires, in addition to the regular crew of six men, two sawyers on the skidway. The logs, which in such cases are cut into lengths that are multiples of 4—as 12, 16, and 20—are snaked to the skidway, where they are sawed into 4-foot stick and piled. A gang of eight men will cut, resaw, and pile from 9 to 12 cords per day. In cutting 14-foot lengths a gang of six men will cut and skid from 14 to 16 cords a day. The price of hauling varies with the distance. For two or three trip hauls per day, with 2 to 3 cords per sled, the charge is ordinarily \$1.60 per cord. If the distance is short and several trips are possible the price is less. The stumpage price is a very variable quantity, ranging all the way from \$2 to \$3.50 per cord. Such pulpwood is supposed to contain, besides spruce, 10 per cent. of balsam and 10 per cent. of hemlock. As a rule, however, the percentage of balsam runs much higher. Since balsam pulpwood is hardly ever bought by itself, the price could not be determined, but it is probable that pure balsam pulpwood would command from 50 cents to \$1 per cord less than the ordinary pulpwood now offered on the market.

The stumpage price of balsam when not cut with spruce in Maine, is in the neighborhood of \$3.50 per 1,000 board feet, while spruce stumpage ranges from \$4 to \$7, a conservative average being about \$5. Timber more than one-half mile from a landing is yarded; that is, put in piles of 20,000 to 50,000 board feet, and is hauled in February and March, when the snow is good. Hauling costs 50 cents per 1,000 board feet per mile. In addition, it takes four men at the yard to shovel snow off the piles and help load. Three men are required at the landing to mark and roll the logs. Each logger within one-half mile of a landing hauls as many logs as possible direct to the landing without yarding; this saves the cost of handling the logs twice. Thus, while the cost of hauling direct to the landing may not be over \$4 per 1,000 board feet, yarding and then hauling increases the cost of getting out the logs to the landing to about \$7 per 1,000 board feet. This cost, however, varies with the number and size of the logs, the distance to drag or haul, and the ease with which the timber can be reached. Dense undergrowth, necessitating the addition of one or more swamper to the crew, will, for instance, increase the cost of getting logs to the landing.

From \$6.50 to \$7 ought to cover, on an average, the cost of getting logs to the landing. Long drives, interrupted by large stretches of dead water, make driving an important item in Maine.

Balsam is driven along with spruce and, except for its greater sinkage on long drives, behaves in almost the same way. It seldom causes a jam, for if a balsam log gets crosswise in a bad place it usually breaks. Spruce, on the other hand, would hang and perhaps start a jam.

Protecting Ties Against Wear

At the annual meeting of the American Wood Preservers' Association at New Orleans, January 20-22, the above paper was read by Howard F. Weiss, director of the Forest Products Laboratory, at Madison, Wis. Pictures, diagrams and tables are omitted.

In 1907 the American Railway Engineering Association sent out a number of letters asking various railroad engineers what per cent. of their ties failed from decay and what per cent. from mechanical destruction. The replies in general were that about ninety per cent. of oak ties failed because of decay, as against twenty-five per cent. of cedar. In other words, the mechanical destruction of the ties varied from a minimum of about ten per cent. for oak to a maximum of about seventy-five per cent. for cedar. The many good results which have been and are being secured by timber treating engineers in protecting ties from decay are placing each year a larger per cent. of our ties in the cedar class in so far as their mechanical life is concerned. This means that the problem of mechanical protection is one of increasing importance. It is a waste of preservative, effort and money to inject into ties an amount of preservative which will protect ties beyond their mechanical life because after the tie has once failed mechanically it is removed from the track and destroyed. With costly treatments, particularly such as are given by the full-cell creosote process, this problem is of immense importance to railroads, as it may mean a waste of hundreds of thousands of dollars yearly. If the tonnage of the road is light, as with many traction companies, the arguments here advanced for tie plating and more expensive fastenings are not of such immediate importance. In fact, in such cases it may often prove inadvisable to tie plate, especially if the ties are made of a hard wood. In this paper I wish to discuss briefly the protection of ties from mechanical causes of failure and will not go into the subject further than to indicate certain points of interest to timber treating and railroad engineers. By the mechanical destruction of ties I mean rail wear and spike cutting.

The protection of ties from rail wear is secured by means of tie plates. These serve two primary functions: (1) The protection of the tie from the crushing and pounding action of the rail due to the passage of rolling stock; (2) the protection of the tie from the grinding action of the rail caused by its tendency to creep and vibrate.

A great variety of plates has been advocated to protect ties from destruction. They may be classed, however, as wood and metal plates. The former are rather extensively used abroad, and are also under test in this country. From the experience which we have had with them in different test tracks laid in co-operation with American roads, the results have not thus far been satisfactory. Wood plates offer little or no reinforcement to spikes when these are subjected to a lateral thrust; consequently, spikes are more likely to bend and rail spreading is likely to occur. Furthermore, the plates often tend to work loose from under the rail and if spikes are driven through them they split badly. In some of our tests, where wood plates were attached to the ties, they actually became imbedded in the ties. If the tie is slotted so that the plate can be inserted in such a manner that its upper surface will be level with the top of the tie many of these objections are overcome, but this method of treatment increases the cost of preparing ties for service and also weakens them.

More satisfactory results have thus far been secured, in our experiments at least, with metal plates. These vary considerably in form, but may be classed into two types, viz., pronged or ridged plates and flat plates. The object of the former class is to imbed the plate in the tie, thus making it a part of the tie and assisting the spikes in resisting rail spread. The chief disadvantage we have noted to this type of plate is its tendency to gouge into the wood and at times completely destroy it. The untreated interior of the ties is thus exposed to the weather and decay is readily admitted. Flat plates do not have this objection, but are troublesome at times in that they become loose and rattle under the rail. Furthermore, they simply rest upon the tie and offer no reinforcement to the spike against lateral thrust.

A feature in tie-plate construction which has perhaps not been given the serious attention to which it is entitled is the size of plate for the kind of tie on which it is to be placed. A light, small tie-plate is of little or no value in protecting the tie from destruction. It is necessary to have the plate of sufficient surface area so that the crushing action of the rail will be distributed as widely as possible, and to have sufficient thickness, so that no buckling will occur. As is generally known, the various woods which are now manufactured into crossties differ very appreciably in hardness and in crushing strength. Cedar, loblolly pine, etc., are considerably weaker than black locust and white oak, for example. If cedar ties are interspersed in a track with white oak ties and the same sized tie-plates are placed upon both, the cedar ties are going to fail from mechanical destruction far more quickly than the white oak ties. That track is best laid which makes each tie carry its proportionate share of a passing load; therefore, to secure best result, tie-plates should be so designed that the

unit loads placed on various kinds of ties will be approximately the same. Perhaps best results are secured by placing in the track ties of uniform hardness, at least in given stretches.

The Forest Products Laboratory has made over 2,000 tests on about seventy species of timber to determine their resistance to crushing when the force is applied at right angles to the grain as in the case of crossties.

I have taken as my standard for comparison with other woods a white oak tie. A number of woods are stronger than white oak, and hence the size of tie-plate which they would require would be smaller than that required by white oak. On the other hand, most of the ties have a less crushing resistance than the standard white oak tie, and for this reason require larger plates. There is a fixed relation between the specific gravity or dry weight of the wood and its strength; in other words, woods which are light in weight are low in crushing resistance, while woods heavy in weight offer considerable resistance to crushing. It might be claimed that this property of hardness or strength should be considered in fixing the price of crossties; that is, ties which have a low crushing strength, and which consequently require a large-sized tie-plate in order to be protected from mechanical destruction, should, other things being equal, sell at a lower price in an untreated condition than similar ties which are heavier and which offer greater resistance to mechanical destruction. If this principle were carried out in practice it would result in some cases in a readjustment of tie-plates. It is felt that such a readjustment is warranted from the standpoint of efficient track maintenance.

The question has frequently arisen, "What effect have the different preservative processes upon the strength of ties?" This matter has been investigated by Dr. W. K. Hatt at Purdue University. The difference in strength between treated and untreated ties, except in the cases of those treated with crude oil, is so slight as to make this a matter of little practical importance. Of course, this statement assumes that the ties are properly treated and not injured by excessive heating or other causes.

The function of spikes is to hold the rail to the tie, which, analyzed, means that they must exert a resistance to pull and resistance to lateral thrust, the former resulting from the so-called "bumping" of the rail, the latter accentuated by the centrifugal force exerted by the train in rounding curves. As in the case of plates, a great many methods have been advocated for fastening rails to ties. The Patent Office is filled with devices aiming to secure this apparently simple end. I cannot even attempt to consider all of the various schemes advocated but will call your attention to three types of construction in more or less extended use. These involve the use of the cut spike, and the dowel.

The cut spike is by far the most generally employed in this country. It is cheap, enables a quick laying of the rail, and is easily applied. When freshly driven in sound, heavy timber it also gives very satisfactory results. It has, however, been subject to severe criticism because it frequently becomes loose in ties and under such condition may cause an unsafe track. This feature has led to considerable experimenting in an effort to overcome these disadvantages.

The screw spike has been most successful thus far in removing the chief criticism levied against the cut spikes, viz., its low holding power. Screw spikes, however, are more costly than cut spikes and more difficult to insert in the track. Their use, however, is growing and will doubtless continue to do so, as this form of spike possesses considerable merit. In a large number of tests made at Purdue University, a part of which were conducted by the Forest Service, it was found that screw spikes had from 1.7 to 3.8 times the strength of common cut spikes against pull, and from 1.2 to 2.4 times the lateral resistance of the common spike. In round numbers one screw spike is about as efficient as two cut spikes so far as holding the rail to the tie is concerned.

The large number of ties cut from comparatively soft woods, such as loblolly pine, have encouraged certain roads to experiment with hardwood dowels. These are simply plugs of hardwood, such as red oak, usually creosoted, screwed into the tie. The spike is then driven or screwed into this hardwood dowel. By this method a very firm grasp of the rail to the tie is secured, and should the spike become loose and worn, the hardwood dowel can be unscrewed from the tie and a new one inserted. Of course, such a method of treatment is expensive; and, furthermore, it has a disadvantage in that it weakens the tie unless the ballast is kept in very good condition. Where it has been put to practical test this method has, however, yielded very satisfactory results.

This is a feature of preparing ties for service which is also of comparatively recent origin in this country. As by far the larger majority of crossties now in use are hewn, the problem of securing a uniform bearing of the rail or tie-plate on the tie is of great importance. Unfortunately, common practice in this country consists in adzing such ties after they have been treated. This removes the preserved layer of wood at the very point where its protection is most needed. In order to secure best practice it is absolutely essential to

have the rail or tie-plate bear uniformly on hewn ties, and the proper time to adze is before the ties are treated, and not after. While the mechanical adzing of ties is still in its infancy, it is quite likely machinery to do this work will become a part of the well-equipped tie-treating plant.

Another feature in too limited use at present is the boring of the ties for the insertion of spikes. When screw spikes are used it is absolutely essential to bore a hole into the tie in order to insert them, and if this hole is bored after the tie is treated the unprotected interior is more or less exposed to decay. Boring should, therefore, be preferably done before the ties are treated. Even with the ordinary cut spike, boring is of direct value. The spikes driven into a hole three-eighths inch in diameter has a greater holding power than spikes driven into the tie not bored. This is due to the fact that when a spike is driven into a bored tie the fibres are not crushed to the same extent as when no boring has been made.

The following general conclusions can be drawn from this paper:

(1) The increasing number of treated ties being used in this country is increasing the importance of protecting them from mechanical destruction because the problem of protection from decay is being rapidly solved. To secure best results, therefore, a protection of treated ties from rail and spike cutting is strongly recommended.

(2) It is believed that, other things being equal, the size of the tie-plate should depend upon the kind of tie with which it is to be used. Soft ties demand a larger plate than hard ties. It is felt that this fact should be recognized in fixing upon the price of various timbers for crossties.

(3) Preservative treatments with creosote and zinc chloride when properly made affect the strength of ties so slightly that any difference in crushing value is of little or no practical importance.

(4) On account of their holding power screw spikes are preferred to cut spikes and can be recommended where high-class construction is desired.

(5) Adzing and boring ties, particularly the adzing of hewn ties, prior to treatment, is considered of prime importance in preparing them for service. Adzing after treatment should be classed bad practice, as it exposes or tends to expose the interior of ties to decay at a point where protection is most needed.

Quarterly Report on Glasgow Trade

Edmiston & Mitchells, Glasgow, in their quarterly timber circular under date of March 31st, report as follows:—Business in this market opened somewhat promisingly at the beginning of the year, and a short spell of reasonably good trade was experienced, but unfortunately these conditions were not maintained for any length of time, a growing tone of dullness having latterly overspread the market. It is somewhat difficult to account satisfactorily for the diminishing demand, although the acute tension in home politics recently has undoubtedly had an adverse influence on business, and the clearing of the air in this direction would certainly do much to restore confidence, which has been sadly wanting of late. There is further, rightly or wrongly, a growing conviction amongst buyers that values will attain to lower levels in the near future, and such being the case, it is natural to find a tendency to restrict purchases as much as possible to the covering of immediate requirements only. It cannot be denied that values generally have been shaping easier, which is partly due, however, to the fall which has occurred in freights.

Imports from British North America

Yellow pine logs.—The only sales reported since the opening of the year were 25 logs 1st class wood and some 80 logs 2nd class wood, low prices being obtained in both instances, but more particularly as regards the latter. Little or no enquiry exists to give hope of any early appreciable reduction being affected in the heavy stocks.

Oak logs.—A moderate demand has been in evidence, chiefly for first class timber of good average size, in which some selling has transpired at firm values. Small and 2nd quality woods have been little asked for, and there are still considerable stocks of such on hand. Southern States timber has met with rather better request, engendered, no doubt, by the scarcity of sizeable Quebec logs.

Elm logs.—A few sales were reported of 1st class rock elm, consisting chiefly of wood suitable for shipbuilding requirements, at firm prices. Some contracting business, also transpired, although to a lesser extent than usual. The stock on hand amounts to 1,121 loads, and averages 40 cubic feet per log.

Birch.—Logs.—Arrivals were few and light in extent. A fairly steady business has passed at quite firm prices, and the heavy stocks carried over from last year are being gradually reduced. Contract business this year was of a rather restricted nature. Planks.—The import was of trifling extent. A moderate business has transpired from stored stocks, while a limited amount of contracting was arranged.

Yellow pine deals and sidings.—The demand has shown some improvement, a fair amount of selling having been witnessed since

the opening of the year, and stocks have been appreciably reduced. Sidings have met with better request, although at unsatisfactory prices generally. Third pine deals, 11-inch by 3-inch, have commanded reasonably steady sale, and the stock of these is now well reduced. Shippers have this season only fixed contracts to a moderate extent, buyers in instances showing an inclination to take the chance of being able to fill their requirements on the open market rather than commit themselves at shippers' quotations.

Liverpool Market Report

Smith & Tyrer, Limited, Liverpool, England, in their monthly trade bulletin, report upon trade conditions during the month of March as follows:—There is a lack of confidence shown by the importers, who in most cases are inclined to adopt a "wait and see" policy. A normal business has been done, but there is no elasticity about the demand. Pitch pine has not been much enquired for, and sales have mostly consisted of parcels forced off under pressure. The situation is unsatisfactory and prospects are not promising. Hewn timber is in little demand. Sawn timber, after going stronger in sympathy with freights, has fallen again to its previous low level. Prime lumber is in better demand but lower qualities are difficult to sell. Hardwoods generally are moving off slowly. Spruce deals, locally, have been over imported by the liners and prices have fallen, and will fall further unless a wiser policy is adopted. It seems folly to flood an overstocked market. Good stocks for season shipment hold their own in value chiefly owing to the firmness of sellers. Pine deals.—Lower Port deals are wanted, but there is not much available. Ottawas keep their small but steady demand. Hemlock.—Shippers are not inclined to accept prices offered. Pacific Coast woods are moving slowly. There is an ample stock of Douglas fir logs. Clear spruce.—The reduction in prices has tended to stimulate the demand, and the market for this material is expanding.

Lumbermen's Building at the Panama Exposition

The Lumbermen's Building and House of Hoo-Hoo which is to be erected at the Panama-Pacific International Exposition is in charge of a committee of lumbermen, representative of all interests, which was recently appointed. The executive secretary is Mr. Frederick Boegle, Jr., who has opened offices in the Fife Building, San Francisco, where visiting lumbermen and others identified with the lumber industry will be welcome at all times. The building will be a unique one-storey structure, covering a large area and surrounded by magnificent gardens. Its artistic treatment and landscape gardening are to be of so high a character that the exposition authorities have given it a choice site in the South Gardens facing the Horticultural Buildings. The building will combine the requirements of an adequate exhibition hall and the comforts of a luxurious club house. Provision has also been made for the great national congresses and conventions of organizations allied with the lumber industry. Energetic steps are now being taken to secure the necessary funds for the erection of the building.

Personal Paragraphs

Mr. Simpson, of Brown & Simpson, lumber merchants, Glasgow, is on a business visit to Canada.

The many friends of Mr. Aubrey Cockburn, the well-known boat builder, of Pembroke, Ont., will be glad to learn that he is slowly recovering from a serious attack of blood poisoning, from which he has been suffering during the past two months.

At the annual meeting of the Riordon Pulp and Paper Company, held in Montreal, retiring officers and directors were re-elected as follows:—Charles Riordon, President; Carl Riordon, vice-president; Charles E. Read, secretary-treasurer; J. G. Riordon, F. W. Avery, Walter G. White, E. J. Douglas, directors.

Mr. Harvey A. Warner, formerly with the Imperial Elevator & Lumber Company of Winnipeg, Man., who went in to business for himself in Toronto recently, has accepted a position with the Rogers Lumber Company of Minneapolis, Minn., with whom he was formerly employed for a period of six years. Mr. Warner has already taken up his duties at Minneapolis.

Mr. Kenneth M. Clark, who is associated in business with Mr. James W. Sewall, of Old Town, Maine, will take charge, for two months, of the field work in timber estimating and surveying for the Harvard Forest School senior class. The employment of a practical timber estimator and woodsman by the Forest School is a step in the right direction. Mr. Clark has been associated with Mr. Sewall since 1907 in active field work, and has also found time to complete a course in the Harvard Forest School. He therefore combines the practical with the technical to an unusual degree. He has had charge of several large contracts in forest surveying for Mr. Sewall, and has shown marked ability in his chosen line of work.

A Pointer on Selling by Width

The increasing popularity of the system of selling hardwood lumber according to width, in order that the customer may be able to buy stock that will require the minimum amount of working in his factory, has developed a number of wrinkles that the lumberman has need to look out for in handling the business.

The necessity of pricing this stock in such a way that the increased expense of handling will be taken care of, along with a proper charge for the extra service performed in separating the various widths, is well understood. The customer is perfectly willing, as a rule, to pay the added price, knowing that he is getting it at a figure which is a good deal less than the expense of working random widths would involve. So this feature of the situation is all right, from all standpoints.

In the actual measurement of lumber sold on this basis, however, there are occasional troubles which are likely to be overlooked by the dealer who has not given special study to the details of handling this trade. In measuring according to widths the 12-foot scale is of course used. The inspector who tallies the lumber, unless he has received special instructions in this connection, is likely to follow the usual system, and "call up" widths which are over the half-inch mark, as well as "call back" those which are under it. In the usual system of measurement this is a satisfactory method of equalizing irregularities of width, and the force of habit is sufficiently strong to result in the same plan being used when lumber is being loaded according to width, unless the inspector is apprised of the impracticability of using this plan.

In order to dispose of the question satisfactorily, the only safe plan is to use the minimum width all the way through. If 7-inch widths are being picked out, only boards which are a full 7 inches in width, or over, can be used. Those which are $6\frac{5}{8}$ or $6\frac{3}{4}$ inches, and would ordinarily be tallied as 7-inch boards, must be thrown out, as far as that particular item is concerned, while if the same customer is buying lumber 6 inches wide, they can, of course, be used in that connection.

The obvious objection to this plan is that the buyer gets all the better of it. He gets the benefit of all the "breaks," since the seller cannot equalize them by giving himself the increased measurement on the "overs," as he does in the case of most shipments. The customer gets as 6-inch lumber all the boards that are 6 inches and over in width, and pays for 7-inch stock on the basis of all the boards that are between 7 and 8 inches in width.

Those who have not given this question attention may be inclined to discount its importance and to estimate the footage involved in a car as too small to worry about. That this impression is not correct was borne out by a recent experience of a hardwood concern. A carload of thin quartered oak of a given width was shipped to a chair manufacturing concern. The inspector who loaded the lumber was a well qualified and thoroughly experienced man, but he had not gone into the matter of tallying according to widths in a case of this kind, and for that reason he gave his concern the benefit of all the boards that were over the half-inch marks.

The lumber was shipped and in due time the customer was heard from. Though the distance was over a thousand miles his kick was felt distinctly at the point of origin of the shipment, and that without the aid of a seismograph. He kicked on the measurement of the lumber entirely, and not on the grade, which was all right. But the measurement differed from that of the shipper by over 1,000 feet! As this was on a shipment of good quartered oak stock the amount involved, as the reader will have anticipated, was enough to make the members of the firm which made the sale do some tall figuring trying to understand how it happened. A little correspondence developed the fact that the buyer had measured the lumber in the form indicated, while the shipper had used the ordinary board measurement system, to his ultimate detriment.

The worst feature of the whole situation was the fact that the purchaser of the lumber could not use boards that were of less than the specified widths, because they had to be finished for use with that dimension. The buyer, as a matter of fact, was purchasing dimension stock, although the result was obtained not by remanufacturing but by sorting, and obviously he specified widths that came as close as possible to the dimensions of the finished material. When he got narrower stock than this, he was unable to use it, no matter how strongly the argument might be made that it was unfair to the lumberman to deprive him of the measurement on all boards wider than the dimension specified.

In the case referred to the settlement was made on a basis that eliminated most of the profit, but members of the firm are now experienced enough to avoid making the same mistake over again. Hereafter, when they sell a car according to width they are going to allow for the loss in measurement which will result from the use of the 12-foot scale in this way and are going to make a price accordingly.

This, incidentally, is the only solution of the problem. It might be argued that the proper way to handle it would be to sell according to half-inch divisions, and that when sorting for widths in the lumber yard to pile 6-inch, $6\frac{1}{2}$ -inch, 7-inch, $7\frac{1}{2}$ -inch, etc., separately, so that when the time came to load out a car of any given dimension there would be no necessity of giving the buyer something for which he would not be called on to pay. But there are a number of practical difficulties in the way of the adoption of this plan. One is the greater amount of stock that would be needed to carry on the business, and to get a carload of any given dimension, and the other is that buyers seldom ask for widths of odd dimensions, usually ordering according to whole numbers.

The plan which seems to fit in with the needs of the situation most exactly is to keep in mind the probable loss that will be suffered and then charge for it. The lumberman realizes thoroughly when he sells a car of selected stock that he has had to put in additional labor to sort out the special widths wanted; he probably has had to do a good deal of careful sales work in order to find buyers for the various widths, and consequently he knows that he must ask a price for the lumber which will take care of the extra expense.

In the same way he can figure approximately, by reason of experience (and he can make actual tests which will determine the facts), what the loss in measurement is when the 12-foot scale is used as described, compared with ordinary board measurement of random widths, and consequently the proper system is to make an allowance in the price for this factor. Otherwise the result is likely to be a smaller profit per thousand than appeared from a superficial examination of the price at which the lumber was sold, compared with the figures quoted on unsorted material.

Another point that should be remembered in sorting lumber according to width, with the idea of being able to offer special service to the consumer, is that the especially wide stock necessarily must carry a higher margin of profit than the narrower boards. This is for the reason that the wide stuff usually has a considerable premium anyway, and the lumberman could get this without sorting if he were to sell on a basis of a shipment containing a given percentage of wide stock. As far as these items are concerned the labor of sorting them is more or less unnecessary, from a sales standpoint, and is not required in order to get the maximum price for them. It is, however, a big convenience for the buyer who has been contenting himself with buying random widths, with a guaranteed percentage of wide stock, to be able to buy that class of lumber exclusively if he needs it, and he consequently should pay more in proportion for it than would be indicated by the premium offered for the percentage of extra wide stock included in an ordinary shipment.

As a matter of fact, many lumbermen who have gone into the question of sorting for widths have found that it is much easier to get the advanced price which they ask for narrow stock than for wide. Consumers who have been using the narrow stuff, but buying random widths and having to do a lot of ripping in order to get the right dimensions, have realized at once what a big saving they are making in securing the dimensions they need, while those who want wide stock have been getting a good deal of it by the payment of a comparatively small premium for its inclusion in a shipment of random widths. They fail to realize the extent of the service offered them by the lumberman who is prepared to give them exactly the widths they need.

The lumber dealer who is featuring the sale of special widths is a good deal like the millman who is cutting up his lumber into dimension stock: he must get a price commensurate with the added value he has given his lumber if he is going to be able to continue handling it in that way. The surest method of coming to grief in this business, just as in dimension manufacture, is neglecting the cost of performing the various features of the operation and failing to make a proper charge for them. Only by studying all of the elements involved and determining the proper price with reference to them can a fair profit on every sale be insured.—Hardwood Record.

Quebec Wharfage and Storage Charges on Wood and Pulp

New wharfage and storage charges have been fixed by the Quebec Harbor Commissioners in a new set of by-laws which they passed, and which were approved by the government at Ottawa recently. It is provided that lumber, timber and wood pulp for export will be free of wharfage charges, while pulpwood will be charged at the rate of $12\frac{1}{2}$ cents per cord. The storage charges will be as follows: On timber, lumber, pulpwood, ties, etc., per square of twelve feet, \$1 per square per month or part of a month.

Buffalo jobbers are figuring on placing an order for 3,000,000 feet of yellow pine, a great part of it being bill stuff, says the American Lumberman. They look upon this trade as bound to improve steadily, especially as they find that the lumber can be sold in Canada. The prospect is that Canada will soon be receiving much more lumber than it is selling to the United States unless it be the spruce and cedar that goes down the coast toward New York.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Box Co., Ltd., Toronto, Ont. 7-11

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS, Hamilton, Ont. 7-12

Wanted

500,000 feet 1-in., 1½-in. Soft Elm.
700,000 feet 1-in. Basswood, Ash and Birch.
For delivery as soon as dry this year. State what you can supply and lowest prices on cars.
Box 945, Canada Lumberman, Toronto. 3-8

Hardwood Piles

Wanted immediately, Birch, Beech or Maple Piles, cut from straight and found live timber, not less than 8-in. tops and 14-in. butts—length 35 to 40 ft. State best price and point of shipment. Box 9, Canada Lumberman, Toronto. 8

Wanted to Buy

One million feet 1-in. Dead Cull Pine, also fifty thousand feet 1-in. Cull Spruce or Hemlock. Apply

M. BRENNEN & SONS, Hamilton, Ont. 6-9

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

Wanted to Buy

250,000 ft. 4/4 No. 1 C. & B. Basswood, winter sawed.

Ten cars 4/4 x 12-in. and up Soft Elm.
One car 4/4, 6/4 and 8/4 1s and 2s Soft Elm.

Box 998, Canada Lumberman, Toronto 7-10

Lath and Lumber Wanted

1000 M. Pieces No. 1 White Pine Lath.
1500 M. Pieces No. 2 White Pine Lath.
2500 M. Pieces No. 3 White Pine Lath.

500 M. 1-in. Log Run Brown Ash. Mill Culls out.

500 M. 1-in. Log Run Basswood. Mill Culls out.

300 M. 1-in. Log Run Soft Elm. Mill Culls out.

Now sawn or to be sawn.
Quote lowest prices car mill.

C. A. SPENCER,
Eastern Townships Bank Building,
Montreal, Que. 7-8

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

For Sale-Lumber

Red Pine For Sale

Four carloads 2 x 4 and up; 18 ft. to 24 ft. P. O. Box 392, Ottawa, Ont. 3-t.f.

For Sale

200,000 feet of Cedar. Can be sawn to order of purchaser. Address Box 8, Canada Lumberman, Toronto.

For Sale

Quantity of White Oak Lumber, assorted thicknesses.

A. P. EBERT,
Box 287, Huntsville, Ont. 8

Hard Maple and Hemlock

We have half a million feet hard maple and half a million hemlock. Can cut dimension stock. Write best offer.

Trenton Cooperage Mills Limited,
Trenton, Ont. 7-10

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
Montreal, Que. c

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE,

Timber Department,
1-t.f. Janesville, Wisconsin.

For Sale-Machinery

For Sale

or exchange for heavy type surfacer, lath machine, lath boiler, lath cut-off, new; manufactured by Wm. Hamilton Mfg. Company, Peterborough.

STONE LUMBER CO.,
Marksville, Ont. 8

Mill Machinery For Sale

Complete saw mill plant for sale including two single cutting band mills, gang, and all equipment in first class working order. For particulars apply to the Dickson Company, Peterboro, Ont. 5-8

Second Hand Machinery

150 to 175 h.p. Corliss Engine, 16-in. x 36-in., new two years ago.
75 to 100 h.p. Brown Automatic, 13-in. x 30-in., in excellent condition.

500 to 750 h.p. Buckeye; a good sawmill engine.

Boilers, 72-in. x 18-ft. and 54-in. x 14-ft.

THOMAS HOBBS,
Mail Building,
Toronto, Ont. 7-t.f.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position wanted as circular saw filer. Nine years' experience. W. C. Morton, Richmond, Ont. 8

Position wanted as sawyer. Circular. single or double cut band saw. Box 306, Parry Sound, Ont. 8-11

EXPERIENCED LUMBER INSPECTOR wants position. Address Box 986, Canada Lumberman, Toronto. 6-9

Position wanted as band saw filer, double or single cut. First-class references. Address Box 972, Canada Lumberman, Toronto. 8

COST CLERK desires position with a woodworking concern. Ability to organize. Practical and experienced. Best of references. Box 990, Canada Lumberman, Toronto. 7-8

Position wanted as band saw filer, or can take full charge of resaw band. Four years' experience. Strictly temperate. State wages offered. Box 985, Canada Lumberman, Toronto. 6-8

Saw filer, band or circular, wants position. 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 5-8

First class sawyer wants position for the coming season on right hand single cutting band mill. 32 years of age. Strictly sober and steady. Six years' experience sawing on fast mills. First class recommends. Ray Cole, Norwich, Pa. 8

Experienced White Pine Shipper and Salesman wants position, either in the manufacturing or wholesale end. Practical knowledge of the lumber business from stump to market. Best of references. Address Box 7, Canada Lumberman, Toronto. 8

Position wanted as Lumber Inspector of soft and hard wood. Could act as Salesman. Twenty-six years' experience. Capable of superintending manufacture of lumber in big saw mill. Speaks French and English. P. Provost, Box 157, Hull, Que. 8

Wanted-Position By Experienced Manager

To take charge of lumbering operations. Can get results and furnish the highest credentials. Canadian. Box 973, Canada Lumberman, Toronto, Ont. 8

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Experienced book-keeper for retail lumber business. State fully previous experience. Box 6, Canada Lumberman, Toronto. 8

WANTED—Lumber Traveller for Ontario. Would prefer young man with experience. Reply confidential. Box 5, Canada Lumberman, Toronto: 8-11

WANTED—One band sawyer and one setter for mill with steam feed and nigger and steam set works. Apply to Donald Fraser & Sons, Limited, Cabano, P.Q. 9

WANTED—The Fraser Brook Lumber Company, authorized capital \$100,000, paid up \$53,000, want agent to sell their balance of stock (shares). Apply to J. E. Pineau, Secretary, Fraserville, Que. 7-8

WANTED—Two band saw setters, and two edgemen. Mill starts April.

Prince Albert Lumber Company, Ltd.,
7-8 Prince Albert, Sask.

Business Chances

For Sale—Retail Lumber Yard and

Planing mill, \$5,000. Stock at invoice prices. Last year's business \$25,800. Natural gas power. Railway siding. 400 ft. metal sheds, etc. Caledonia Milling Co., Ltd., Caledonia, Ontario. 6-9

Active Partner

Wanted to join practical man now operating sawmill at Barriere, B.C., on the C. N. R. Within easy reach of Prairie markets and a plentiful supply of good lumber. Write Box 997, Canada Lumberman, Toronto. 7-9

Money To Invest

Thoroughly practical lumber and mill man has \$2,000 to invest in a good going lumber concern, in which he could have a responsible position. Can handle any part, logging or milling operation. Address Box 248, Woodstock, N.B. 8

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. t.f

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Big Money in Silos

Big money can be made in properly constructed wooden silos and tanks. We are large U. S. manufacturers and have unquestionably the best methods for silo and tank construction. We want to sell our Canadian Patents outright to some live manufacturing firm in Canada. For particulars address Box 1, Canada Lumberman, Toronto. 7-8

British Columbia Saw Mill and Timber Limit For Sale

A 25-thousand feet capacity Saw Mill, and 90 million feet first class Spruce, Red Cedar, Hemlock and Yellow Cedar, etc., under B. C. Special License. At good shipping point near Prince Rupert, B.C. Inspection invited. A. Culbert, P. O. Box 456, Prince Rupert, B.C. 6-11

For Sale

Complete sawmill outfit, practically new; capacity 12 M. ft. hardwood. Marine boiler, 50 h.p., and Dutch oven. 40 h.p. engine. No. 4 carriage with overset lever. Cable feed. Friction canter. Double edger; cut-off saw and a full complement of large and small saws and belting, including a 14-inch 2-ply leather driving belt. Frame building, iron roof.

Also Long Mfg. Co. Clipper Shingle Machine in best of condition, and outfit complete; will be sold with sawmill or separate. Mill at Angus, Ontario. Apply Frank McMulkin, Barrie, Ont., who will show mill, or Chas. T. DePuy, Rochester, N.Y. 8-10

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

Liquidator's Sale of Valuable Sawmill Property and Plant

Re: Winding Up Act, R. S. C. Chapter 144, and

Re: Charlton Sawmill Company Limited

With the approbation of the Master-in-Ordinary of the Supreme Court of Ontario, The Title and Trust Company, the liquidator herein, will up to 12 o'clock noon of the 2nd day of May, 1914, receive at its office, Traders Bank Building, Number 61 Yonge Street, Toronto, sealed tenders marked "Charlton Sawmill Company, Limited Tenders," for the purchase of the real and personal property of the Company hereunder mentioned. The advertisement and tenders pursuant thereof are subject (as to chattels) to private sale by the liquidator in the meantime.

Parties desirous of submitting tenders may inspect the said property or any of the articles hereby offered and the inventory thereof upon application to the liquidator, The Title and Trust Company, at its said office or to Thomas Hoy, Collingwood, Ontario, for both the freehold and chattels en bloc or separately for each or any part of machinery or chattels.

Description of Property

PARCEL 1. Consisting of about 20 acres within the Town limits of Collingwood, County of Simcoe, Ontario, the particular description of which may be obtained from the liquidator, and upon which are erected the mill building, the office building, dwelling and boarding house.

PARCEL 2. ALL AND SINGULAR the machinery of said sawmill consisting partly of one Waterous single cutting band, one Garland single cutting band, steam niggers, steam kickers, 10 inch steam feed, one double Garland edger, live rollers, trimmers, 200 feet of transfer, etc., etc.

The mill is in good condition and running order with a capacity of about 80,000 feet per 10 hour day.

The Real Estate is subject to a first mortgage upon which the balance of principal money unpaid and interest up to and including the date of this notice is the sum of \$2,162.16; and to a second mortgage upon which such balance is the sum of \$5,500.50. These mortgages to be assumed by purchaser.

Conditions of Sale

Tenders will be a sum including said mortgages.

An accepted cheque payable to the liquidator for 10 per cent. of the amount tendered shall accompany each tender which will be returned if tender is not accepted. The purchaser will be required to pay an additional 40 per cent. on notice that tender has been accepted, the remainder to be secured to the satisfaction of the liquidator and payable with interest at 5 per cent. per annum in equal portions in 30 and 60 days after acceptance of tender, possession of chattels on payment of 50 per cent. and completion of said security. Possession and conveyance of the real estate on payment in full with proper adjustments. The highest or any tender not necessarily accepted.

No warranty is given by the liquidator and none expressed or implied shall arise in acceptance of any tender.

The purchaser will be required to search the title at his own expense and the liquidator shall not be required to produce any title deeds or muniments of title or abstract of title other than those in its possession.

Dated at Toronto this 1st day of April, A.D. 1914.

THE TITLE AND TRUST COMPANY,
Liquidator.

JOHNSTON, McKAY, DODS & GRANT,
Solicitors for the Liquidator.

Miscellaneous

Wanted—Rails

1 1/2 tons No. 12 relaying rails, new or second hand. Also 1 Frog and Switch, one turn out and two Lumber Trucks for 3-ft. track. Lawrence Bros., Ltd., Canoto, Ont. 8

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Uses for "Wood Waste"

Sawdust is now becoming of sufficient value to ship it to points where it can be used for ice packing, stable bedding, stuffing for upholstery, packing glassware, for shipment of metals, crockery, etc. Sawdust is even used for the manufacture of gunpowder and in Europe it is compressed into briquettes and sold for fuel. A few plants have already been organized for utilizing sawdust for briquettes. Slabs, edgings and tops are now being profitably converted into cooperage stock, broom and other handles, wood turnery, wooden dishes and novelties, dowels, furniture rounds, etc.

These small things seem unimportant at first, yet there were used last year in New York State alone over 800,000 board feet of wood for dowels which are small wooden pins used principally to hold parts of chairs and other kinds of furniture together. Over 962,000 board feet of hardwoods were used for such small articles as shuttles, spools and bobbins. Brushes and brooms consumed over a million and a half board feet, while such apparently unimportant materials as toys used nearly 3,000,000 board feet of wood in one year. All of these articles and a great variety of

others can be made from mill waste, short lengths, defective butts and tops that have formerly been considered of no value and left in the woods. Last year over 470,000,000 board feet were used in New York for boxes and crating. This is equivalent in itself to about 3/5 of the total lumber of the State.

Many Uses for Oak and Ash

The London Timber News says that to the uninitiated in these matters, the vast quantities of oak timber that are annually cut up to keep pace with the trade for boards and all other converted wood sizes seems out of all proportion to the number of trees

that are annually felled. But then it must be remembered that an oak tree of, say, fifty cubic feet content will cut into a very large amount of boarding, posts, poles, or any of the hundred-and-one uses to which the timber is applied. For furniture manufacture and wagons for mineral traffic, building materials, dome and roofs of public buildings, cart and wagon bottoms, wheel spokes, railway sprags and many other important purposes where great strength and lasting properties of the wood are points of consideration, oak timber is largely in use. Ash timber is no less useful, especially where strength and suppleness of the wood are qualities in request.

Review of Current Trade Conditions

Ontario

Very contradictory reports have been received from Northern Ontario regarding the outlook for the drive this spring. The situation apparently is one which leads to much uncertainty. So far as could be gathered from a number of reports, however, there was a large amount of ice in the lakes up to the middle of April, and, as a great many of the rivers in the north have been improved for driving purposes, the probability is that, what with the water conserved by dams and the water which will come when the ice melts, there will be a good supply for the drives. In spite of this, however, a number of northern operators have been expressing pessimistic views regarding the outlook. Some operators are of the opinion that the drive will result in a large quantity of logs being held up, while others express a firm conviction that the drive will be one of the best that has been experienced in many years. There is apparently no means of determining in advance just what conditions will be. There is no doubt that the output in the woods during last winter was secured under exceptionally favorable weather conditions and was large enough to furnish plenty of stocks for the coming season's trade, if the drives are successful.

From retailers in many parts of the province we gather that trade, although quiet, has been of a fairly satisfactory nature during the past month and that the outlook for the summer is fairly promising. Farmers are reported to be in a very sound condition financially. Collections, although dragging to some extent, have been fairly good, most parties coming forward with payments when pressed. Prices are about the same as they were a year ago, with the exception of a few lines which may be scarce in particular localities. Retailers report that most of the yards are fairly well stocked for the spring trade, and apparently the large majority of them are confidently expecting that, once the building season has definitely opened, the demand for lumber will be quite satisfactory.

A noticeable improvement is reported in trade conditions at Ottawa, practically every lumberman being now a great deal busier than he was a fortnight ago. American buyers have made a number of important purchases. Building operations are much larger than they were a year ago, as indicated by permits during the past month for buildings valued at \$307,800 as compared with \$194,489 during the corresponding month of last year. The indications are that the cut in the Ottawa Valley this year will be considerably larger than last year. Sash and door factories are very busy.

Eastern Canada

The backward spring season has retarded building operations at Montreal, but dealers report that the volume of business is growing steadily. A number of Montreal yards report that they have made a larger turnover during 1914 to date than during the corresponding period of 1913. The outlook for the export trade with Great Britain is not very bright, according to recent advices from England. This situation will be rendered still less satisfactory by an increase in railway freight rates from the Ottawa district, averaging about one cent a hundred pounds, of which the railway companies have given notice.

Reports from Boston state that nearly all the large producers are asking \$25 for spruce dimension, although some sales are still reported at \$24.50. Backward spring weather is inducing retailers to hesitate about their purchases. It is expected, however, that the \$25 basis quotation will continue. The movement of random is slow, but a firmer tendency is reported. Quotations are mentioned at \$21.50 for 2 x 3 and \$22.50 for 2 x 4, while for 2 x 5, 2 x 6, and 2 x 7 the price ranges from \$20 to \$21. Sales of 2 x 8 are reported at \$22. The demand for 2 x 10 and 2 x 12 is dull, quotations being at \$24 to \$24.50 and \$24.50 to \$25 respectively. Spruce covering boards are hard to sell at \$22.50. The demand for No. 2 matched spruce boards is quiet, the price ranging from \$24.50 to \$25 or lengths of 10 to 16 ft. Since Canadian beaded spruce boards have been refused free entry by customs officials, it has been easier to maintain the price. The outlook for spruce at New York is rather uncertain, although most of the yards have much lower stocks than is usual at this time of year.

The hardwood trade at Boston is a little more active than it was a few weeks ago and prices are steadier. Plain oak, one inch, is selling at \$61 to \$66 and maple at \$33 to \$40. Other quotations are:—brown ash, \$58 to \$60; basswood, \$43 to \$45; red birch, \$54 to \$56; sap birch, \$44 to \$47; cherry, \$95 to \$100; white quartered oak, \$88 to \$92.

It is difficult to report upon the value of lath at Boston. Some

business, however, is going on steadily at \$4.25 for 1½-in., while \$4.15 and \$4.10 are also reported. The demand is not so good as it should be at this time of year. The usual quotation for 1½-in. lath is \$3.75 to \$3.80. Shingles are moving slowly. Standard extras are quoted in most cases at \$3.65 and white cedar clears at \$3 to \$3.25, with second clears at \$2.75 to \$3. Supplies of inferior grades are said to be heavy.

Great Britain

Considering the time of year, the lumber trade in Great Britain is comparatively brisk. A number of rumours are current regarding heavy reductions in prices, some of them being based upon facts. Nevertheless, prices in general are about steady and the tone of the market continues strong. Throughout Great Britain the wood market is probably in as flourishing a condition as in any other country, and in view of the general feeling that the commercial depression will only be of short duration, reduction in f.o.b. values are not expected to be permanent, even for the present season. No further drop in prices is expected.

The Timber Trades Journal, of London, in its latest issue, says:—

"As far as the timber business is concerned, it is well known that the trend of the Canadian export trade is in the direction of a curtailment of supplies to the United Kingdom, largely explained by the steady expansion of the domestic and American demand. This position is further emphasized by the statistics just issued for 1913, which show that with the exception of pine, birch and elm there is no increase in the export to the United Kingdom, while the production of manufactured wood goods for this market is appreciably less, doors, etc., being down more than half in value as compared with the preceding year. It is noteworthy that the mahogany received from this side amounted to 397,821 feet, a little more than during the preceding year. On the other hand, Canada's export of timber to the United States showed no diminution, but a slight increase, and the import from that quarter indicates a marked increase upon many items, notably in oak, pitch pine, shingles," etc.

At London, the trade is in a rather complicated position, holders of stock complaining of the difficulty in making satisfactory sales, while, on the other hand, deliveries week by week maintain their totals. For the week ending March 21st, the deliveries amounted to 3,211 standards as compared with 2,465 standards during the corresponding week of last year.

A little more activity is reported at Liverpool in connection with forward buying of spruce deals, several cargoes having been placed at figures somewhat higher than present prices for liner parcels. Liner parcels are arriving more freely than importers desire and the prices obtained have suffered. The spot market at Liverpool is steady, but the volume of trade is small. The demand for Quebec pine deals is limited. The principal importers are apparently content to allow their Ottawa purchases to remain awaiting shipment until the market condition is more promising. Transactions in birch on c.i.f. terms are light.

United States

Reports upon lumber trade conditions in the United States continue to vary greatly according to localities; weather conditions, crop prospects and financial and industrial situations having a great deal to do with individual reports. In the southern pine trade a more hopeful condition is reported. Building operations in many of the large cities are progressing at a seasonable rate and in some cities are expected to surpass those of last year. The northern pine trade is fairly active, but the demand cannot be said to be more than moderate. Prices of northern pine are steady. The hemlock trade is fair with prices unchanged. The volume of new business for hemlock in the east is light, although there are good prospects for the building demand. Retail yard stocks of hemlock in the upper lake country are reported to be low and a good demand is expected with the opening of navigation. Irregularity is reported in the demand for hardwoods, which apparently is not yet up to the volume that was expected earlier in the year. Prices, however, are firmly held in general. Plain oak is moving steadily and there is a fair demand for ash. Northern hardwoods remain very firm. Birch logs are said to have been sold in Wisconsin as high as \$25 a thousand on cars, which is from \$2 to \$3 higher than the prices of a year ago. Elm is also about \$2 higher than last year. One-inch maple is very firm and there is a better demand for basswood than there has been for some time.

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Continues Quiet

St. John, N.B., April 7; (Special to the Canada Lumberman):—There is very little change in the situation at this point up to the present. The spring weather is very slowly warming up, the ice still remains solid in the rivers and lakes and unless warm rains set in immediately, it looks very much as if the lumber mills at St. John will not get in full blast before the first of May, although last year the first of April practically saw them all under steam and sawing. Messrs. Stetson Cutler & Company have been operating their two mills for about a week. Messrs. Murray & Gregory's mill began operations this morning; these are the only mills to start to date.

Local business from the yards and factories has not increased to any great extent, owing largely to the cold backward weather, but business can be said to be better than it was. Very little heavy outside work has yet begun. Prices for refuse, and low grade stocks which are used locally are somewhat higher than a year ago, but the advance is unlikely to continue when the mills start, as this time of year always sees the yards short of low grade stocks and a larger price is paid. Eleven dollars per thousand is now being paid at the mills for cuts of refuse boards, planks, scantlings and deals. Merchantable spruce boards, 4 in. and up wide, are bringing about \$16 per thousand at the mills, for factory and local uses. Clears are selling at about \$25 per thousand.

Both the English and American markets are about marking time, the English market being much the better of the two, but stocks there are very heavy. This will not have any great effect upon the mills which have sold their cuts ahead for the season, as the buyers are well able to carry the stocks if necessary. This we hope will not be the case. The cuts, as explained some time ago, were sold at \$17 to \$17.50 per thousand superficial feet for the ordinary English specification.

In the American market there is practically no business to be found, and therefore no market price has been established. In New York business is even worse than in New England. No stocks of any kind are moving forward from St. John to the American market, with the exception of a few laths. These are being sold at about \$3.75, New York.

Freights to the English market are very low, ranging from 35s to 37s 6d, with more tonnage offering than is needed. To American ports \$3.00 per M. is the price to New York.

Conditions for driving look very favorable up to date. Plenty of snow remains at river and the cold weather is preserving it, so that it has not wasted to any extent.

The quantity of logs to be driven to booms of St. John River Log Driving Company this year will be about 54,000,000, should all get into boom limits. The company have not quite finished their arrangements for driving the lower corporation as yet.

Prices for logs are not so high as they were some time ago, as the farmers here hauled in more logs than it was expected they would get earlier in the season.

Montreal Trade Improving Gradually

Montreal, April 11th (Special to the Canada Lumberman): Although the season is backward, with a consequent tendency to retard building, lumber dealers state that business is satisfactory. It is picking up in a very encouraging way, and several local yards report a larger turnover as compared with the corresponding period last year.

The building returns for the first quarter of the year indicate that more permits are being taken out for residences, and that there is a decrease in those for the larger structures. For the three months the total value was \$1,855,196, as against \$1,867,847 in 1914. For last month the permits were for \$959,496.

It will of course be some time before navigation opens, but advices from England are not optimistic as to the current year's export business, particularly as regards pine. The proposed increase in railway freights from the Ottawa district will be an unfavourable factor in this branch of the lumber trade, as it will mean an added charge to goods which already have to meet with keen competition in the open markets of Great Britain.

The railway companies have given notice of an advance of lumber freights from Ottawa rate points, which materially affects Montreal. In order to meet water borne competition the companies have a lower tariff during the summer months, water carriage being always cheaper than railway carriage. In 1908 the rate was increased about

a cent per 100 pounds, and the companies now seek still higher charges on the ground that the cost of maintenance has risen. The new rates apply to both domestic and export business, the increases varying from ½c to 2c per 100 pounds, with an average of 1c per 100 pounds.

There is a good demand for chemical pulp, and some of the Canadian mills are oversold. The ground wood market is slow, orders from the United States being scarce. In the eastern portion of the United States the water conditions are very good, and until there is an alteration in this respect, Canadian mills will not receive much business from over the border. Newsprint is a fairly good market. Advices from New York state that contracts have been renewed at last year's prices.

Ottawa Trade Again Active

Ottawa, April 6th, (Special to the Canada Lumberman): The anticipated revival in trade has arrived with the coming of spring. Practically every lumberman in this district reports that business within the last two weeks has picked up to an encouraging degree. Several American buyers have visited local dealers and have made large purchases.

Locally, indications are that the coming season will be a record breaker. Last month there were 44 building permits issued in the city to the total value of \$307,800, as against 38 permits for the same month last year, the value of which was \$194,489 only. There have been no alterations in prices during the present month.

Practically all the men are now out of the lumber camps and the mills are in readiness to begin operations at any time. As soon as the ice is out of the rivers, driving will commence, which will be around April 20th. If nothing unforeseen happens, most of the firms throughout the Ottawa Valley expect to make a considerably larger cut this year than last. Nearly all of J. R. Booth's large cut is sold and the balance will be, before many weeks.

Export firms are preparing for the opening of navigation on the St. Lawrence, which will be towards the end of the month, though the insurance companies do not put their policies into effect before May 15th.

The sash and door factories throughout the city are exceptionally busy after a rather lengthy period of dullness. The Estate James Davidson now have 250 men working nine hours per day. Next week the ten-hour day will commence for the summer season. This firm is filling several large orders for boxes. At the mill in Davidson, Que., millwrights are putting the machinery into shape ready to start work about the 20th of April. The cut there this year will total over 15,000,000 feet. Two new machines have just been laid down in the city factory, one a new 12-ton veneer press, made by the Francis Machine Company, of Rushfield, Indiana, and the other a box planer, made by Baxter D. Whitney & Sons, Winchendon, Mass. Mr. Grant Davidson, general manager of the Estate Davidson, says that plans are being prepared for displaying in the north frontage of the factory, portable houses, refrigerators, etc., made by the firm. It is proposed to put in four big plate glass windows, each 18 feet long and 10 feet high. The products of the factory shown in these windows can be seen plainly by passengers coming out from the Broad street station of the Canadian Pacific Railway.

Mr. John R. Booth, head of the famous lumber firm that bears his name, celebrated his 87th birthday at his home yesterday. Had his birthday not fallen on Sunday this year, he would have celebrated it as he has most of his other birthdays by working. Although he met with a severe accident at his plant a few months ago, he is now able to get down to the mills at the Chaudiere Falls every day on crutches.

Mr. Gordon Edwards, of the W. C. Edwards Company, returned home last week after attending the annual convention of the North Carolina Pine Association, held in Norfolk, Virginia.

Sir Henry Egan, head of the Hawkesbury Lumber Company, and Lady Egan, are spending a vacation at Hot Springs, Va.

St. John Log Driving Company's Meeting

The annual meeting of the St. John River Log Driving Company was held at Fredericton, N.B., on April 2nd. It was reported that the total quantity of lumber to be driven and rafted by the company this year would be about 61,000,000 feet, including the cut on the Tobique. The president stated that it had not yet been decided whether the company would handle the river drive by itself or let it out.

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Black Walnut

Much has been written as to the way in which mahogany is taken from the woods, the way the trees are located and felled, and the way hewn logs are gotten down to the waterways, and from there to the ocean. Very little has been said, however, regarding the painstaking work necessary in selecting the raw material and producing the beautiful pieces of furniture made of our own domestic walnut. Ten or fifteen years ago walnut in furniture, stair work, and interior trim was considered the height of fashion and luxury, but possibly because of the inability of the wood finishers at those times to create the bright, cheerful finishes which the average home builder now demands and possibly also to a degree because of the increasing prices of walnut, this most desirable wood gradually lost its popularity until up to a few years ago it commanded but a very small proportion of the prestige which it formerly enjoyed, says an American contributor. The character of the wood used in the ordinary run of various types of household furniture does not necessitate any unusual effort as far as the selection and manufacture of the wood is concerned. As a general thing the logs are picked up by men and concerns who make a business of buying walnut logs in small lots and disposing of them to concerns who manufacture them into lumber and veneers. For this purpose the ordinary run of plain walnut is used without any special regard to figure or curl. The wood used for this purpose is merely in the form of logs and is sold as such, and from them manufactured into lumber and veneers for furniture and similar purposes. However, there is a splendid demand which is never quite taken care of for this wood in the most luxurious form, and that is the wood with the beautiful mottle; the so-called figured and curly walnut which commands excellent prices and is highly thought of for all character of high-class cabinet work. In fact, it is difficult to find any character of wood growth which shows a more beautiful surface when properly finished than this highly figured curly stock. It is in this line of work that the walnut log men take the greatest pride. Indeed, it is necessary that these men have a wide and varied experience that they may make a success of the accumulation and disposal of curly and figured stock.

While the plain wood is gathered and sold merely in the form of logs, the curly and figured stock, on the other hand, is almost always secured from the sources of supply in other forms. The figure and the curl are the result of natural freaks in the growth and formation of the wood. As a general thing instead of being found in the logs, they are found in the stumps or in the "burls," which to the layman in the ordinary form present an appearance about as attractive as an ultra-mature tree toad. The experienced walnut man, however, quickly determines whether or not such a "butt" as he calls it will develop figure or curl, when he has gone so far as cut the tree. He takes great pride in his ability to tell in a general way just what character of figure each stump that he selects will develop in the veneer or lumber. It is not to be inferred from this that the walnut man merely goes through the woods, looks at the walnut tree, and is able to ascertain exactly for what use it is best suited. As a matter of fact there are usually but one or two trees in every hundred cut which develop any figure worth while that will justify their being placed in the class of figured walnut.

The work of selection of figured butts is exceedingly tedious, and when the walnut man discovers one which he considers marketable, that is, a butt that shows that it possesses a strong suggestion of figure or curl, he has it shipped to his assembling yard. Here it is split and the bark and sapwood trimmed off pretty closely to the heartwood. In the figured stock the sapwood is of no commercial value. Various methods are used to preserve the butts after they have been prepared in this way to minimise checking and other deterioration. In this connection one of the oldest of the walnut assemblers of America says that after he has split and trimmed his butts he buries them in sawdust immediately, which procedure keeps them in a most excellent condition for an indefinite period. The veneer manufacturer is a man interested in the purchase of these fancy butts, and as soon as he hears of any special offerings he makes a journey to the assembling yard and makes his purchases. The butts are then shipped to the veneer plant, where they are sliced up into the required veneer which is further matched up in the piano manufacturer's panel plant for high-grade piano facing. As suggested, the proper selection of walnut in the stump is really more of an art than a cold-blooded business proposition. A man has almost to be born to this work and to pass through years of training in order that he may be able to recognise the beauty he is seeking when he finds it.

Yellow Poplar and Its Uses

There is more lumber produced from yellow poplar than from any other southern hardwood except oak. The commercial range of the tree is restricted mainly to the southern Appalachian mountains of the Virginias, Carolinas, Kentucky, and Tennessee, where it grows to be more than 100 feet high and over 5 feet in diameter. Some specimens have been found in Virginia nearly 200 feet high and 10 feet through.

The wood itself has the same general characteristics as that of white pine, and its range of uses is about the same. Each is utilized for almost anything not requiring great strength or toughness.

The qualities which favor the extensive use of poplar, says the report, are its straight grain, its lack of odor, the readiness with which it takes paint, and the ease with which it can be worked. Doors, paneling, packing boxes, type cases, drawers, kitchen, woodenware, and toys are made largely of yellow poplar. In Tennessee wooden mixing bowls are turned out in sizes up to 4 feet in diameter from one piece of wood. Yellow poplar stands well in situations exposed to the weather, as in pumps, outside steps, shingles, and fencing. It is not durable in contact with the soil, though it can be readily treated with preservatives.

Estimating and Figuring Mill Waste

By Chas. Cloukey

The following letter, referred to me for discussion, opens up a subject full of interest to mill operators, and while many of them are still groping for the light, there are others who claim to see their way clearly; but read the letter first:

"I should like to know if any manager of a wood-working mill has made a study of the best method of finding out correct waste on lumber used in sash, doors, blinds and interior trim. Probably some one has a system in practical use that is giving fine results; if so, it would be valuable to the trade.

"We are generally getting so that we have accounting systems that give overhead charges down to one-tenth of 1 per cent., but in the matter of material, which is by far the most important item, we are doing more or less guessing. I think most of us are making tests of occasional orders, and after the lumber is brought into the mill and cut into pieces and lengths required, we make allowance for pieces and strips left over, which we expect to use again. This cannot be an exact basis, as we all know some jobs cut to better advantage than others, and some waste will work into other orders and some finally goes into firewood. Most of us are basing our estimate of waste on these occasional tests, and I think, by a careful study of the subject with a systematic method, it can be improved on.

"Some firms charge to the job all the material brought into the mill, regardless of waste, but I do not think this is right. Probably we should not figure costs so closely on our product that we should get much closer than either of the above-mentioned methods, but I do think we should at least know exactly, as the records will help us in many ways in knowing the proper grades to buy and will also show how efficient our cutters are. This cannot be obtained by occasional tests, but only by keeping records of all the material used for an extended period.

"The difficulty is going to be in getting the waste on different kinds of lumber when different grades are used of one kind, such as pine, for instance, where No. 1 cuts are used for doors and No. 3 for sash and blinds. The waste from No. 1 might be used with No. 3 for sash, and the clerk, in figuring up the cutting bill of sash, would not know whether to credit it as coming out of No. 1 or No. 3 cuts. This might be accomplished by crediting to No. 1 or No. 3 cuts what is known to have come from either of these grades, and that about which there is a question could be credited to miscellaneous account. I think this would be such a small proportion of material cut, it would give very nearly accurate figures.

"Would it be possible to apportion the waste credited to the miscellaneous account to the different grades, at the end of the year, according to the proportion of each kind used? Again, is it possible to work the whole matter of waste out on the cost-of-lumber basis? These are the two important parts of the proposition I haven't been able as yet to work out clearly myself, and I would like to hear some discussions from others on these two points, also the waste proposition as a whole."

It has been the writer's privilege to become acquainted with quite

Montreal West, P.Q.

a number of mills in different parts of the country, and my observations have been that with the same quality of supervision the percentage of waste is about the same in all mills doing a regular mill work business. By this I mean mostly odd and special work, but still quite a little in stock sash and doors, moldings, casings, frames, fixtures and so forth. The efficient means of keeping down the waste percentage is, first, careful selection of the best lumber at hand for the job; second, intelligent cutting, and third, a comprehensive system or plan for handling the scrap pieces worth saving for future jobs.

Taking up the matter of lumber, we find that the bigger stocks always cut cheaper material, both as to lumber and time. I do not mean that 10,000 ft. of one item will enable a cutter to get out 2,000 ft. of cuttings any cheaper if the pile is all of one width and length, but if it is divided up into half a dozen widths and lengths, it stands to reason that the cutter will spend less time and have less scrap left.

As it is not always possible for a mill to keep on hand the most desirable assortment of lumber, perhaps on account of the way the hurry work comes in or on account of limited capital, it may be true that one mill can operate on a smaller percentage than another.

The point of cutting cheaper lumber in order to raise its grade is one well taken, but it is also one that should be very carefully watched. The extra waste and extra work in cutting will go a long way in evening up the price, especially if the number of pieces involved is small. So let us keep this point in mind when we come to adjust our percentage of waste.

Another feature of importance in keeping the waste down is the variety of the work handled by the mill. We often get a bit of published advice along this line, but unfortunately we are not always in a position to use it. Just the other day a writer advocated working scrap into surveyors' stakes—very good advice for the boom towns, but not much for the old ones. We got out some 25,000 stakes one summer and nearly as many two other summers, but by that time there had been eight sections of prairie staked off into town lots and the stake market took a permanent slump.

The reader must understand that we are not talking about the speed of cutting now, but about the percentage of waste in the lumber itself. However, the time of cutting enters into it indirectly, for if the cutter spends too much time in holding down the waste item, he may waste more in time than he saves in lumber. This also applies in cutting to raise the grade.

The best plan for handling scrap lumber for which there is no immediate use is divided into two parts. The one part deals with strips and consists of ripping them to stated sizes for stops, quarter-round, base shoe, glass bead, small panel molds and the like and racking them up in a convenient manner. Never pile strips out in a promiscuous heap and expect to get anything profitable out of them. Rip them up every day or two and burn or sell what you cannot use.

Scrap cuttings are much more difficult to handle if they are put in horizontal piles; in fact, piles of scrap are uniformly unprofitable. The scrap shed or room should be arranged to stand all the material on end. If the pieces are longer than 6 ft., they should be returned to the lumber piles. If they are shorter, they should be stood on end and ranged in single rows from the wall out about 4 ft. If the tiers are wider than that, it will be difficult to handle them without letting some of the outer pieces fall down and become disarranged.

Any one who will try this plan will find that the scrap-pile will require about one-tenth of the space it will occupy with the pieces laid flat. The reason that it will be smaller is because it will be used up closer. You can go into a scrap room with this arrangement and at once see both sides of any piece without disarranging the others, or without even picking up the piece you are looking at.

We all know how discouraging it is to see the end of a piece just like we want and dig it out, only to find that it is too short for our purpose. Then we tackle a piece that we can see is long enough, but when we pull it out we find it has a wind-shake, knot or streak in the middle of it. We are wasting valuable time, and so we go to the lumber pile, where we can see what we are doing, and let the scrap lie where it is, to be buried still deeper. If there is a fuel value to the scrap made in the mill, that part fitted for fuel should be converted at once. If it has a greater value on the market as stovewood, it should be prepared for that commodity at once and delivered or stored.

The writer of the letter above has practically outlined one of the approved systems of figuring lumber in mill work, and it was by such simple, comparative means that one of the most up-to-date concerns in the country arrived at a fixed per cent. to add to the amount of lumber appearing on the cutting bills. However, it seems to be the practice of more mills to keep track of the lumber brought in on each job, or at least try to do so, and it would seem at first thought that this is the only true way of keeping account of the material in a job. But we run up against so many modifying phases of the subject that it does not look so simple after all.

The yard man will bring in what he thinks will cut the job, but the cutter will turn down about 25 per cent. of it as unfit to cut. This

amount must be replaced with enough to finish the job, and then it is found that about 5 per cent. of the amount has been cut wrong and has to be replaced. The machines spoil 2 per cent. of it, and, on account of the peculiar sizes, about 20 per cent. of the amount brought in is taken out in strips and cuttings. Clearly this is not a representative case.

The concern above referred to found that a uniform addition of one-sixth fitted its case very satisfactorily. This covers all waste in errors as well as in sizes and defects, and is added to the money value of all lumber appearing on the cutting bills of the order. Of course, it would add greatly to the accounting, to add the waste to each item or to each different kind or grade of lumber as the figuring progressed, so it is added after the total value of the figured sizes is found.

It has been the practice of several mills coming under my notice to use a 10 per cent. waste figure, and I am inclined to believe that it can be done under favorable circumstances. By this I mean good stocks of well-assorted lumber, efficient cutting, good scrap management; and let us not forget that the scientific arrangement of cutting bills is a large factor in keeping a low percentage of waste.

When we speak of waste the term should be one of comparison, and should apply to the foot value of lumber and not to any of the actual material. For instance, all the material in a plank should conserve some purpose. It may be worth 3c per foot and produce cuttings worth 4c or cuttings worth 3c and core stock worth 2½c after it is glued up. Still there are some knots, strips and sawdust left which have a fuel value, either in the shop or out of it. The only way to arrive at this value is to get it for a given time, as suggested, and credit it back to the lumber account at the end of the year.

The mention of glued-up core stock, crating materials and the like, which are really a converted waste, brings to mind a complication of the overhead expense which, with many others, makes me think that any planing mill business claiming to have figured overhead expense to within one-tenth of 1 per cent. of perfection has surely overlooked something. But as this is not a discussion of overhead, I will only say that when the scrap is converted into core stock and figured on the billing sheet at 2½c per foot, it is not good bookkeeping to charge the labor thus expended to overhead expense.

Some mills put all of the crating lumber in the overhead account. This might be alright if the crating was all bought by the car at a known price, but when the bulk of it is the poor edge of a common board ripped off on time charged to orders and resawed on overhead time, it is a sure thing that it will affect the figuring for the year to lose the entire crating lumber in the overhead account. In the process suggested by the letter it would come out as waste, or part of the difference between the lumber bought, the lumber used as per the cutting bills and the lumber shown by the inventory.

With mills doing but little crating this item might not mean much, but with those using several cars every year it would figure as that much waste to increase the percentage to be added to the cutting quantities. So, if a mill is setting about to make a rate of its own, based on several years' experience, it is well to make a complete analysis of the way the lumber is finally disposed of, and then the rate obtained will be of real value.

In our mill the cutting bills are made in quadruple, using carbons and sheets of four different colors. One particular sheet is the office copy and does not leave the accounting department. The others are put in the mill and one goes to the yard boss. The other two are kept in the mill, and if the work is sent out K.D., the yard bill is sent along to the customer with the goods. Each workman has a personal check for the items worked by him, which he puts on the bill as he does his part—but that is getting away from the subject.—The Wood-Worker, Indianapolis.

An Efficient Lifter and Shifter

The Herbert Morris Crane & Hoist Company, Limited, Peter Street, Toronto, have issued an interesting bulletin "B3" descriptive of the Morris Traveling Spur-Gear Chain-Block. The bulletin contains interesting illustrations which draw attention particularly to the snug construction of these travelling lifting-gears. When an ordinary chain-block is suspended by means of a hook from the cross-bar or eye of an I-beam trolley, much head room is wasted which might otherwise be used to great advantage. Morris Spur-Gear Blocks are made in a great many different types, each arranged for a specific set of conditions for which it is peculiarly adapted. A high speed of lifting is obtained by using a small gear ratio, which is only rendered possible by the extreme accuracy of the work put into the cutting of the gears and the setting out of the steel side plates. The Morris Traveling Spur-gear Chain-block is built right into the trolley so that no head room is wasted. This combined lifter and shifter has solved many hard problems and is well worth investigation by all who have any difficulties to overcome in regard to moving heavy material in their plants.

OPPORTUNITIES

WE own and offer for sale on attractive terms a few especially well selected tracts of timber running from 50 million to one billion feet that are ready for immediate operation, having a good local demand at high prices.

The timber on the Pacific Coast is the last stand of the great forests. Well selected timber in British Columbia is the best investment on this Continent and offers especially attractive inducements for manufacturers.

EDGINGS

Ontario

Mr. W. Jones, representing a firm of German shipbuilders is on a business trip in Southwestern Ontario, buying a large quantity of select hardwood.

The ratepayers of Orillia, Ont., passed a by-law on March 30th for granting a loan of \$50,000 to J. R. Eaton & Sons, Limited, to assist them in the erection of a woodworking factory which is to cost \$50,000.

The Simpson Planing Mill Company, Limited, has been incorporated with a capital of \$40,000, with head office at Toronto, Ont. The provisional directors are A. Rhind, J. Magee, C. W. Wills, E. J. Cluskey and H. B. Duthie, all of Toronto, Ont.

The Maple Leaf Lumber Company, Limited, has been incorporated with a capital of \$40,000, with head office at Toronto, Ont. The provisional directors are E. F. McDonald, B. P. Fitzpatrick, J. M. Adam and A. C. Rutherford, all of Toronto, Ont.

The partnership heretofore carried on by Wm. J. Lovering, Geo. Wilfrid Boake and Ellwood W. Boake, under the firm name of the Yonge Street Lumber Company, at Toronto, has been dissolved by mutual consent. The business will be carried on in future under the same name by Ellwood W. Boake.

The Pembroke Lumber Company, Pembroke, Ont., have sold their timber berth, known as No. 1 and 2 Jocko to J. J. McFadden, Renfrew, Ont. The company state that they will start their mill operations at Pembroke on the first of May with the finest average of logs which they have ever taken out of the bush.

The Canadian Handle Company, Strathroy, Ont., have awarded a contract to John J. Smith, Strathroy, for the erection of a woodworking factory at a cost of \$50,000. The building will be 180 x 40 ft., of brick and fireproof construction. W. H. Braddon, 546 King Street, London, Ont., is interested in the company.

Ferguson & McFadden's sawmill at Tomiko Village, 27 miles from North Bay on the T. & N. O. Railway, was totally destroyed by fire on April 2nd, the loss being estimated at over \$50,000. The large stock of lumber in the mill yard was saved, although the residence of Mr. E. L. Bucknam, adjoining the mill, was destroyed.

The Andrews Lumber Company, Limited, Sault Ste. Marie, Ont., have nearly completed the erection of their mill at Alona Bay, Ont., and expect to have it in operation in the near future. The plant will turn out about 4,000,000 feet of hardwood, spruce and pine lumber fully half of which will be birch, in addition to a quantity of pulpwood, cedar ties, cedar poles, and white pine board timber.

The Abitibi Pulp & Paper Company's paper mill at Iroquois Falls, Ont., will probably be ready for operation on June 1st. The pulp machinery will be operating in May. The paper mill will be 500 feet in length and nearly 300 feet in width. It will be of solid concrete construction. 40,000 cords of pulpwood are already piled on the banks of the Abitibi and Black rivers and their tributaries awaiting to be floated to Iroquois Falls.

A bill has been introduced into the Ontario Legislature by the Hon. Wm. H. Hearst, Minister of Lands, Forest & Mines, for the purchase of the timber limits of the Pembroke Lumber Company in the townships of Fitzgerald, White, Edgar, Bronson, Stratton, Barron, Master & Guthrie, amounting in all to 306¾ square miles. The price to be paid by the government is \$185,000. The territory will be added to the Algonquin Provincial Park.

Eastern Canada

Villeneuve, Limited, have opened a new yard at St. Jerome, P.Q.

Coggel & Long, Sackville, N.B., have commenced the erection of a woodworking factory.

The next annual convention of the Canadian Forestry Association will be held at Halifax, N.S., on September 2, 3 and 4.

P. Beauchemin & Fils, lumber dealers, St. Paulin, P.Q., have been registered. The members are: P. Beauchemin, A. & J. Beauchemin.

Thos. E. Fee & Company, lumber dealers, Montreal, P.Q., have been registered. The members are: Thos. E. Fee, H. Palarde and E. A. Fee.

According to a despatch from London, England, Mr. J. E. A. Dubuc has obtained capital for a very large extension of the plant of the Chicoutimi Lumber & Pulp Company, Lake St. John, P.Q.

Price Bros. & Company, the well-known paper and lumber people, are erecting a sawmill at St. Gedeon, Lake St. John district, for the purpose of cutting up their large logs. The pulpwood will go as usual to the existing mills.

A new company, known as Pulp & Lumber, Limited, has been incorporated, with head office at Montreal, to carry on the business of pulp wood and lumber manufacturers. The provisional directors are H. Lampard, engineer, Westmount, and H. M. G. Belew and B. C. Bellew, of Montreal.

Lynch and Bruneau, Limited, have been incorporated with a capital of \$50,000, with head office at l'Epiphanie, Que., to carry on business as manufacturers of boxes, crates, etc. The provisional directors are W. Lynch, and M. Bruneau, of l'Epiphanie, Que., and J. O., E. and H. Mathieu, of Montreal, Que.

The Ouatichouan Falls Paper Company, Ouatichouan, Que., have drawn up plans for alterations to their pulp mill, at a cost of \$20,000. The alterations will include the installations of wet machines, grinders, etc. J. E. A. Dubuc is manager and the engineers in charge are Grenon & Lavoie, of Chicoutimi, P.Q.

The Brompton Pulp & Paper Company, East Angus, P.Q., will erect a new paper mill for the production of news paper. The contract for the machinery has been awarded to J. H. Horne & Sons Company, of Lawrence, Mass.

The buildings will be located on the west side of the River St. Francis and will be 72 x 444 ft., two storeys high, of concrete, brick and steel with a granite roof. The power house adjoining will be 52 x 108 feet, and power to the extent of 1,000 h.p. will be developed. The equipment of the mill and power house will be thoroughly modern and up-to-date.

The new sulphite mill to be erected at Bathurst, N.B., by the Bathurst Pulp & Paper Company, will be designed by G. V. Steffanson, of the Canada Paper Company, Windsor Mills, P.Q., who is widely known among pulp and paper manufacturers as a successful designer and constructor of pulp and paper mills.

P. N. LeBlanc, Moncton, N.B., is enlarging his woodworking factory, with a view to having more working space. The equipment is not being increased. Mr. LeBlanc reports that he is "preparing for an enormous season." He is installing a draughting department and is anxious to hear from manufacturers of building materials in general.

J. T. and C. Donohue, of Quebec, who have bought all the stock of pulp wood on the limits and in the yard of the East Canada Power and Pulp Company at Murray Bay, Quebec, will put the mill in operation next month. The plant, which has been idle for over a year, owing to liquidation proceedings, will employ over three hundred men.

The Fraser Brook Lumber Company, Limited, Fraserville, P.Q., which was recently incorporated with a capital of \$100,000, is the owner of an attractive limit, 15 miles square on the Matapedia River, at a distance of three miles from the I. C. R. The limit is thickly wooded and has never yet been cut, or injured by fire. It is well watered for driving purposes and in other ways presents a very interesting proposition for the company which intends to operate upon it.

J. O. Gilbert & Son, lumber and pulp wood manufacturers, Bishop's Crossing, P.Q., report that they intend to build a new plant to take the place of the one they recently lost by fire. The plant will be built and equipped during the summer months and will include an up-to-date sawmill, shingle mill, lath mill, and a plant for dressing lumber, and equipment for manufacturing hardwood flooring and utilizing mill waste. Details of the plant have not yet been arranged, but will be announced later.

Western Canada

McClellan & Balfour, sash and door manufacturers, Edmonton, Alta., have been succeeded by A. Galbraith.

The Stern Lumber Company, Limited, has been incorporated with a capital of \$10,000, with head office at Donalda, Alta.

The Interior Hardwood Finishing Company, Limited, has been incorporated with a capital of \$50,000, with head office at Victoria, B.C.

The Western Canada Lumber & Building Company, Limited, has been incorporated with a capital of \$300,000, with head office at Saskatoon, Sask.

W. J. Milford & Company, box manufacturers, Winnipeg, Man., contemplate the erection of a plant at Edmonton, Alta., which will give employment to one hundred hands.

Sealed tenders are being received by the Minister of Lands of British Columbia, up till noon on May 6th, for the purchase of pulp license X45, to cut 9,400,000 feet of timber, adjoining lot 2242, Pryce Channel, Range one, Coast District. Three years will be allowed for the removal of the timber. Particulars may be secured from the Chief Forester, Victoria, B.C.

Tenders are being received by the Winnipeg Board of Control, until April 21st for five hundred 40-ft. and one hundred 45-ft. cedar poles. Specifications may be seen at the office of the engineer, Mr. J. G. Glassco, 54 King Street, Winnipeg, Man.

The Hunting-American Lumber Company is endeavoring to make arrangements for the erection of a sawmill, costing about \$50,000, on a 4½ acre site near Eburne, B.C. The undertaking depends upon satisfactory arrangements being made with the city council in regard to a mortgage which it already holds over the property. The Hunting-American Lumber Company already operates a mill at Vancouver.

The forest service of United States collected 40,000 pounds of tree seed last year for use in re-afforestation work. The total area reafforested was about 30,000 acres.

The Mountain Lumber Manufacturers' Association have moved their offices from Calgary, Alta., to Nelson, B.C. All communications in future should be addressed to the latter city. The secretary of the Association is Mr. A. E. Frank.

The British Columbia Forestry Branch is anticipating an unusually early dry season this year and fears that the danger from fire will be much greater than other years. Extensive measures are being taken to cope with these conditions.

The Smart-Turner Machine Company, Limited, Hamilton, Ont., are supplying the Goderich Lumber & Milling Company, Goderich, Ont., with one of their Duplex Pumps, and the Hinde & Dauch Paper Company, Toronto, Ont., with one of their Triplex Power Pumps.

A summary of the revenues and expenses of steam railroads in the United States for the month of January, 1914, shows a decrease in total operating revenues per mile of 7.5 per cent. and a decrease in operating expenses per mile of 3.3 per cent. The net operating revenue per mile decreased by \$56 or 19.5 per cent. as compared with January, 1913, which was 40 per cent. greater than for January, 1912.

ADAMS TOWING MACHINE

This machine installed in our pointer will do the work of a steam tug as well as many things a steam tug cannot do. The machine is strong and amply designed, burning coal-oil as fuel. Machine starts direct off coal-oil.

The pointer is particularly well built.

Ribs and frame are bolt fastened; they are made of well seasoned white oak, steam bent where necessary.

The planking is Louisiana Red Cypress.

Rubbing streaks are of hard maple.

The Adam's Pointer has proved a good investment for many lumbermen. Write for catalogue and testimonials.

Disston Steel and Disston Saws

Look for this Brand

Reg. U. S. Pat. Off.

The foundation of the efficient and durable saw is the steel from which it is made.

Expert workmanship carrying out proven designs as to shape of teeth, etc., cannot build a lasting, smooth cutting saw without the foundation of a suitable steel to work upon.

It is chiefly to the extraordinary success of the Disston Plant in producing a superior steel for the purpose that may be attributed the rapid growth and steady demand for Disston Band and Circular Saws.

When the Disston Steel Works were established in 1855 a new era in saw making began. It was not only the first plant of its kind in America, but the first anywhere in the World to produce a perfect saw steel—a steel possessing the peculiar qualities necessary to the manufacturing of a perfect saw. The Disston Steel Works are in charge of an expert who thoroughly understands the requirements of a perfect saw steel and the making of Disston Steel to meet those requirements. Under his supervision are other experts who have, through constant invention and experiment, continued to improve this famous steel.

Disston Steel can never be duplicated, and that is one of the principal reasons why Disston Saws will retain their superiority for all time.

SPARTAN

LEATHER BELTING

is the result of extensive chemical researches and the testing of many different tannages of leather.

Where abnormal external conditions exist Spartan Belting should be employed, as the specially tanned leather and the special cement used in its construction resist the injurious effects of water, steam, oil, gas fumes, and heat generated by excessive pulley friction.

For overloaded drives where it is not feasible to get greater power by increasing the belt speed or the width of the pulleys to enable the use of wider belts, recourse should be had to Spartan Belting, remarkable for its pliability and consequently increased pulley grip and its great tensile strength.

In short, Spartan Belting is adapted for use under all abnormal service conditions—particularly suited for use in saw and planing mills. Its use will ensure your plant against transmission troubles, power losses, and shut-downs for repairs.

Spartan Booklet and full details sent upon request. Why not investigate.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

The Rat Portage Lumber Co., Limited - Winnipeg, Man.

D. C. CAMERON, President and General Manager.

The Three Goodhue Belts

"EXTRA STANDARD" "ACME" "WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions. When you buy a belt—buy a Goodhue. Prices and particulars on request.

DANVILLE - QUEBEC

A New Swage The Best Yet

United States Patent for Sale

View 1.

View 2.

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

Breeze, Denison & Co.
Newburgh, Ontario

FAY-EGAN "LIGHTNING" No. 333 Planer and Matcher--the foundation of many time, labor and lumber saving installations.

The "333" itself forms the cost cutting installation of many up-to-date Planing Mills throughout the country—it will reduce manufacturing costs 40 to 50% and raise grade of lumber 10 to 30% as compared to the old style matchers—but in most cases, the "333" with either Horizontal Band Resaw or Profiler forms the Planing Mill men's ideal.

The cut in manufacturing cost is even greater with one of these combinations than the almost unbelievable economy of the "333" itself.

A 333-335 Matcher-Resaw, with Resaw below the bedline of the matcher will work bevel siding, ship-lap, etc., double thick and resaw at 200 ft. a minute. A 333-288 Matcher-profiler will work ceiling, novelty siding and other formed stock at Fast Feed Matcher speeds. In both cases the machine takes rough stock and finishes it in one operation even more perfectly than when put through separate machines. A 334 Automatic Feeder added to any of these units keeps it full and each piece butting, insuring maximum production every hour.

Every lumberman is more or less acquainted with the Modern Fast Feed High Duty Matcher and Surfacers. However, we have had printed a thorough treatise on this type of machine,—in fact, it seems just like taking one apart in your own office. The combinations of the "333" and all the appliances for Fast Feed Machines are also shown and described in detail. Send us the coupon—nothing more—and we will send this Book.

Annihilate Scale

Potato Scale will positively remove scale from your boiler tubes and can do no injury to your pipes or fittings. Feed water should be regularly treated with Potato Scale to prevent scale, pitting, grooving and honeycombing; it saves fuel and so treats the water that it absorbs more steam.

Send us a gallon of feed water which we will analyze and then mix a sample of potato scale to suit your conditions—this is a free trial, write us.

C. C. Snowdon

Box 1384

Calgary, Alta.

Not altogether what we
say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

IF THE FILER IS ASKED

What saw gumming wheel he prefers, he will say the wheel that cuts clean, quick, and positively cool—the wheel that cuts without rasping, for it is the still wheel that really does the work—a wheel that will hold its shape; that can be fed into the gullet as hard as you please, and will cut without case-hardening the saw;

*He will say the Aloxite
Saw Gumming Wheel*

USE THE SHIMER CUTTER HEADS

For Flooring, Ceiling, Siding, Ship Lap, Jointing, Double Ceiling, Doors, Sash, Blinds, etc,

Made of steel Forgings, they represent the greatest possible strength in compact and workmanlike manner, embodying the vital principles of clearance to all leading Bit Points. The alternate and shearing effect of the cut reduces to a minimum the tearing-out tendency of cross-grained lumber. Cutters have exact shape in their exterior circles, and uniform product is maintained indefinitely without extra trouble or expense.

The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Fig. 203, Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

The Shimer Door and Sash Heads

Save the filing to shape at each sharpening of the cutters. They are made per order, carry in their outline the perfect counterpart of the work, thus by simply filing the Bits and setting them to the gauge the fitting of the manufactured parts is assured.

A solid Door Head with Bits to work 1 to 1 1/4 inch Doors costs only \$18.03, and an Expansion Head only \$20.63. A solid Sash Head to mould 1 to 1 1/4 inch Sash, complete with Bits, costs only \$16.91—an Expansion Head fitted out complete only \$19.51. \$62.87 will give you an excellent solid section outfit, including Door Cope Heads and Sash Cope Heads. If you want the very best with Expansion the cost will be only \$68.07.

Double the Capacity of Your Matcher or Moulder By the use of the Shimer Double Ceiling and Double Flooring Heads.

Run your stock with double tongue and groove and then re-saw. 100 per cent gain in output for an investment of only \$40.94 and upwards.

The Bits on the Shimer Double Heads mark the saw cut line of division on the stock so that the Sawyer can at once detect any variation of the saw and correct it as the board is passing through.

These Heads are not an experiment. We have made them for years and they are in daily use in the best mills of this and other countries. You will find them very complete and practical tools, carrying the Shimer guarantee to do as represented or no sale.

Heads for making Ship Lap

The Shimer Cutter Heads for Ship Lap are so proportioned in the Bits and their seats that a perfect draw cut is made. They work interchangeably with our matcher Heads and always produce good work.

Price, per set, complete, \$33.64 to \$38.48, according to thickness of cut.

Extra Bits for making Wainscoting on these Heads \$1.95 each.

Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete, \$17.87. Also made with 6 or 8 Bits to each Head.

Groove Head, Fig. 2. For plain matching or tongue and groove joint, complete with Bits, \$13.00.

Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With 4 Bits \$16.64.

Our Bedée Knives, recommended by users as the best thin steel knives on the market, can be furnished in any length or thickness on short notice. Write us about your requirements.

This belt pulls 100 h. p. Note the 17-inch slack and then note the tightener used before applying Cling-Surface.

We have already called attention to many installations where Cling-Surface has made belts do more and better work. Here is another: When photographed this engine in the plant of J. S. Haggerty Brick Co., Detroit, Mich., was delivering 100 h.p. from a 6-ft. to a 3-ft. pulley through a 20-in. three-ply leather belt, engine speed 75 r.p.m. Center to center of pulleys 20 ft. Since April, 1903, this belt has had good consistent Cling-Surface treatment and has given no trouble. As shown, it runs with 17 in. slack, and without slip.

Mr. Henry Malesky, the plant superintendent, says about this belt: "You will notice that the heavy tightener necessary before Cling-Surface was used is now hanging in the air, clear of the belt. It is no longer needed."

This belt like all Cling-Surface-treated belts, is giving excellent service. It is just one of hundreds of instances where Cling-Surface is saving many dollars each year simply because it relieves the belts of unnecessary initial tension and entirely eliminates slip.

Tell us your conditions and we will tell you what improvement is possible with Cling-Surface. Write for literature and ask for quotations which are f.o.b. Toronto.

HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from one quarter inch to 2 inches or over

Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS., SAW MFG. CO., Inc., 1103 University Ave., ROCHESTER, N. Y., manufacturer Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

Dixon's Graphite Water-proof Grease

A single trial of this splendid heavy-bodied mixture of mineral grease and flake graphite will convince you of its superiorities, both as a lubricant and as a rust preventive, over any other grease on the market. No saw mill plant should be without it, for the protection of slides, open bearings, chains and wire ropes.

Send for Booklet No. 238 on "Waterproof Grease."

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/3 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

A. Mahony, 512 Wellington West, Toronto

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis., a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

Sold by **The A. M. ELLICOTT CO., Montreal, Que.**
Elevating, Conveying and Transmission of all kinds a specialty

12" MOULDER

12" MOULDER

303—Heavy Duty Foursided Moulder.

A heavy substantial moulder suitable for all classes of work.
It is the most convenient moulder to adjust and operate on
the market to-day.

Heavy feed works. Outside top head support.

Increased weight. Long heavy table.

A new Bulletin No. 303 fully describing this moulder has
just been issued and will be sent to you on request.

CLYDE IRON WORKS

Duluth, Minnesota, U.S.A.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk	3 feet by 6 feet 3 inches	Width of Carriages	33 inches
Diameter and Length Mandrel	2 3/16 by 55 inches	Trucks	7-inch wheels and 1 1/4-inch axles
Size Drive Pulley	20 by 10 inches	Length Track	32, 40, 48 or 56 feet
Feed per Revolution of Saw	0 to 3 1/4 inches	Style and Opening of Blocks	Cl-36 inches
Feed Belt	4-inch Gandy	Style Mill Dogs	Pony Excelsior
Largest Diameter Saw	56 inches	Style Set Works	No. 1 Single Ratchet
Length of Carriages	12, 16, 20 or 24 feet		

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

THE KNIGHT MFG. CO., Canton, Ohio.

Berlin Matcher Success has been Earned

Berlin Matchers have proven absolutely successful during the past year.

By "successful" we mean that our every claim as to their efficiency, producing ability, quality of lumber manufactured and low up keep cost in operation, has been substantiated with every installation of a Berlin Matcher

And this success did not just happen. It was earned by the combined efforts of the most able Berlin Engineers.

Their supreme efforts have been centered upon the one object sought; the pre-eminence of Berlin Matchers as producers of finished lumber.

That necessitates the possession of features or qualities of acknowledged superiority.

Superior design of working features, of supports for those features and of auxiliaries for their immediate assistance in producing perfectly manufactured lumber, possessed by Berlin Matchers has assured their pre-eminence.

And this has all been earned by diligent, consistent and persistent effort to supply our patrons with the best Matchers that engineering ability, plus the experience of practical mill men, carefully applied, could produce.

It is the result of attempts, year after year, to perfect a machine that would manufacture the finest lumber at a cost that insures a profit.

Our efforts have been crowned with success. And, it is to be your success as well as our own. For Berlin Matchers operating in your plant will assure a profit on the finished lumber they produce.

On paper we can give you only our claims,—reasons why you should, at least, investigate the ability of a Berlin Matcher to finish your lumber at a lower cost than you are now manufacturing it.

Given the opportunity we will be glad, actually to demonstrate that ability, in a Berlin Matcher.

More is expected of a Berlin Matcher than any other because Berlin Matchers have always been successful. And Berlin Matchers have always given more than was expected because they are Berlin Matchers.

The features that made this matcher a success are described in a circular that you may have on request.

KEEP THE WORK GOING

Nothing is more important in logging than the prompt and certain movement of cars.

Delays affect the whole work. To avoid delays, locomotives must be reliable and always ready for service.

Our standard logging locomotives are built to insure reliability and constant service. Only tested materials are used in their construction. All wearing parts are made to templates and gauges. Interchangeability of like parts is guaranteed, and long delays waiting for duplicate parts avoided.

Whitney Engineering Co., Tacoma, Wash., North Western Sales Agent

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**Logging Locomotives**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

May we send you specifications?

Canadian Locomotive Company, Limited, Kingston, Ont.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Waterous Built Log Deck of the Pembroke Lumber Company, Pembroke, Ontario.

LOG DECK EQUIPMENT

That Has a "Punch" Behind It

WATEROUS Log Deck Equipment is designed not only to handle heavy work but to handle it fast.

The punch of plenty of power that is behind the action of a Waterous Log Deck is combined with a quickness and snap that shows that the power is applied where it will do the most good.

There is no time lost getting the log from the chains to the carriage. The direct response to every motion of the sawyer's levers through the deck makes the seconds count. It means a speeding up in every part of the mill.

You can buy Waterous Log Deck Machinery for mills of every size. These machines are not in the experimental stage but have stood the test of actual service in Canada's largest and fastest installations.

Our bulletin No. 106 will give you all the details. We will be glad to furnish prices.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

WHY you should install the Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/2 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

No. 5 Roun ling, Chamfering, Planing, Shaping and Boring Machine.

Save a Dollar to a Pound a Day on this Machine

It is a practical machine for a practical man and fills a long-felt want in the vehicle repair shop. On this machine you can plane, bore and round, rims and felloes, poles, shafts, etc., as well as perform various other operations at a great saving of time over hand labor.

This machine is furnished complete with countershaft and is equipped as follows: one three-knife 6-in. buzz planer head with adjustable table and fence; three cornering and chamfering heads each fitted with knives, chip breakers and guides; one special expanding cutter-head with knives and one adjustable boring attachment with four boring bits. Write for descriptive circular and detailed quotation.

ADAMS

COAL-OIL POINTERS

A big advantage of the Adams Pointer is that coal-oil may be used as fuel instead of gasoline. This oil is found in every camp in the country, it is cheaper, safer and more convenient than gasoline and is just as satisfactory.

Adams Pointers reduce your river costs.

Adams Pointers do the work of from six to ten men. One man operates all machinery.

Adams Pointers carry your men to work and leave them fresh for the day's work.

Adams Pointers draw themselves over rapids and portages.

Adams Pointers can be used for warping and sweeping logs out of corners that an Alligator could not reach.

ARGALL BROTHERS Three Rivers, Quebec

Right Footwear for Lumbermen and Sawmill Workers.

Ordinary boots or shoes are useless where there is much dampness or wet. For thirty years we have been making our celebrated oil-tanned waterproof footwear from the finest leather procurable, tanned by our own secret process and known as Skowhegan Leather.

This footwear has been sold under the name of

PALMER'S "Moose Head Brand"

Summer Packs and Harvest Shoes, made 3, 5 and 8 eyelets high for

use in and around the Mills, the Woods, on the Farm and in any place where hard serviceable wear is required. Made on right and left comfortable, easy-fitting lasts, light, but strong and durable. No more tired and burning feet. Made from Oil Tanned Skowhegan Waterproof Leather, with full waterproofed Sole Leather Sole and Heel and Solid Insole. Packed in cartons in 12 and 30 pair cases.

To introduce them let us send you a case at once.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

"The Shimer Limited" with Expansion \$72.46 per set, complete.

Increase Your Output with the Same Labor and Power Costs

Shimer Cutter Heads increase the output by cutting down the waste labor, by faster feed and cleaner finish and by working many pieces in a satisfactory manner which ordinarily would have gone into the offal pile.

Shimer Cutter Heads are provided with Circular Bits, the shape of which never change when the Bits are sharpened, but remains the same until the Bits are entirely used up. This feature also guarantees a uniform product and that material matched or moulded today will fit with that made by the same set of Bits at any time previous.

Our 1914 Cutter Heads have every down-to-the-minute improvement for the saving of time and labor and appeal instantly to the practical mill man as tools that will enable his men to do good work and more of it.

Give them a trial for 30 days and be convinced of their merit by what they can do for you on your own machines.

The Shimer Combination Head for Doors, Sash, Blinds and Mouldings

The Head illustrated herewith is intended more particularly for the mills which make only a few mouldings or Door and Sash patterns and change work several times a day.

The outfit consists of one Combination Head with one set of Sash Bits, one set of Door Bits, one set of Cope Heads and Door Cope Bits, and two Sash Cope Bits for the lower Door Cope Head.

The Bits are quickly changed and set to the gauge, when the Door and Cope moulds or the Sash and Cope moulds will match to a nicety. Bits can also be adjusted for different thicknesses of Door and Sash mould.

Price of outfit complete \$47.31, guaranteed to be made of the best materials and sent on trial.

Planing Mill Supplies

We carry a full stock of many articles needed in a hurry by the mill man, and can fill orders promptly for anything in our line, such as Wrenches, Planer Head Bolts, Nuts, Washers, Gauges, Set Screws, Brass Washers for under Bits, etc. Prices as low as consistent with good work.

Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1 1/2-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench ... \$40.95
Extra Bits for Flooring ... 11.44
Extra Bits for ceiling ... 10.40

With 4 Bits to each Head.

Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1 1/4-in., net only ... \$31.20
Extra Bits 1 1/2-in. face, the set ... 10.40
Extra Bits, 2-in. face, the set ... 12.48

O. G. Batten Heads

Figs. 48 and 49 represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only ... \$31.98
Extra Bits, each, net ... 2.08

Double Ceiling Heads

Figs. 45 and 46 are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, set ... \$40.94
Extra Bits, per set of (8) ... 16.64

Ship Lap Heads

Figs. 38 and 39 are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices:

Heads with one set of Bits to work 15/16 to 1 1/2-in. thick, net ... \$34.84
Extra set of Bits ... 11.96

Door, Sash and Copeing Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head ... \$10.75
Fig. 84, Expansion Door Head ... 13.35
Fig. 86, solid flange, Sash Head ... 9.75
Fig. 206, Expansion Sash Head ... 12.35
Bits to work 1-in. to 1 1/4-in. Doors, 4 ... 7.28
Bits extra to work 1 to 1 1/4-in. Sash (2 Moulded Bits, \$4.30; 2 Rabbeting Bits, \$2.86) ... 7.16

COPE HEADS

Fig. 83, Cope Heads (2) ... \$12.90
Coping Bits, each ... 1.43

The Shimer Box Board Matching Head

make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match 3/4 to 1/2 inch, \$29.15.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, \$11.05.

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34

Toronto, May 1, 1914

No. 9

B.C. Fir and the Panama Canal

What will be the effect of the opening of the Panama Canal upon the lumber trade of Canada? No one will be able to answer the question fully until trade has settled down into its new channels, but most of those who have been thinking of the matter have already found out, to their own satisfaction, that the effect will be wide-spread and important. By way of giving an instance which will indicate at the outset that the effect will be extensive, it is only necessary to mention the fact that the Panama Canal has already been the chief factor in the awarding of the contract for 24,000,000 feet of timbers to be used in Toronto's harbor improvement works, as reported in the April 1st issue of the Canada Lumberman. A small quantity of the timbers for this contract will be delivered by rail, but the contract is spread over four years, and after the opening of the canal to traffic, which is expected to occur about the first of July of the present year, the balance of the timbers will be shipped by vessel to some Atlantic coast port, and from there trans-shipped for carriage to Toronto. Here is a contract involving over \$250,000 taken in advance of the opening of the canal, which the canal has rendered possible. After the canal has come into operation and trade has settled into its new channels, it is reasonable to believe, in view of this preliminary example, that the possibilities for increasing the trade in British Columbia timbers in Eastern Canada and the Eastern United States will be very great.

At present, British Columbia timber and lumber pay a freight rate of 67c per hundred lbs. to Toronto from coast points. Fir in the rough weighs 3,200 lbs. per thousand feet, so that the freight rate figures out at \$21.44 per thousand feet, a pretty stiff handicap when the timber has to face competition from eastern products and southern pine. Under the rates which will be brought into effect by the Panama Canal, British Columbia fir from coast points will reach Toronto for a charge of about 40c per hundred lbs., which figures out at about \$12.80 per thousand feet. Between \$12.50 and \$13.50 is expected to be

the actual rate per thousand feet. This will mean a reduction in freight charges of between \$8 and \$9 per thousand feet and will enable coast manufacturers of fir to lay their products down in Toronto at less than the price of yellow pine. When one considers the increased trade in yellow pine which has developed during the last few years throughout all parts of Ontario and Eastern Canada generally, it is reasonable to conclude that the market for fir under the new conditions will be a large one. Shingles from the coast now pay 75c a hundred lbs., or about \$1.20 per thousand pieces. By way of the Panama Canal the rate will be about 65c a hundred lbs., or about \$1.04 per thousand pieces, making a reduction of about 16c per thousand pieces.

Under the above conditions the trade in Eastern Canada is likely to undergo important alterations. One of the most important changes is likely to be the development of large receiving and trans-shipping yards in Eastern Canada. For the accommodation of the trade, it is probable that companies will be formed in the east which will establish extensive receiving yards where vessel loads of British Columbia products can be stocked and sold to the trade in the required quantities. Such a yard at Toronto would be in an excellent position to handle a large share of the trade for Ontario. An average vessel carrying British Columbia timbers, by way of the canal, will probably hold one million feet or more and it would not require many of these cargoes to tax the capacity of the yards which now exist. Large assembling and trans-shipping yards would seem to be the natural solution of this feature of the situation. Under such conditions moreover, it would be possible for British Columbia fir lumber and finish to be shipped as part of a cargo made up mostly of timbers, thus enabling the whole of the coast manufacturing industry to take advantage of Panama Canal rates and get their share of the Eastern trade. Another manner in which it is possible that the problems of shipment may be solved, would be for a few large dealers in the east to join in making up a cargo. Take for instance a vessel load of British Columbia doors, which would probably swamp a single eastern dealer, under the conditions prevailing to-day. Two or three dealers might join in securing a vessel load, to be divided up among them. The door trade might even be handled by one large firm which would build a warehouse at an eastern point, such as Toronto, and carry in stock at all times a large quantity of British Columbia doors. There are numerous methods in which the trade may be handled. These instances are simply mentioned, to show that, so far as the actual handling problems are concerned, they can be readily looked after and will find the most advantageous solution shortly after the trade opens up.

The solution of price problems, once British Columbia fir reaches the east in large quantities, is a matter of much greater importance than any of those which have been mentioned above. It is already being discussed with great concern by eastern manufacturers of spruce, pine and hemlock and the manufacturers of southern pine. A large New York firm of wholesalers, discussing the situation says:—

"Unquestionably, Pacific coast lumber and timber will be marketed on the Atlantic in unknown volume after the opening of the Panama Canal, which Colonel Goethals promises to be not later than early in July. The eastern and West Virginia spruce manufacturers, as well as the producers of southern pine lumber and timber, cannot be expected to retire forthwith from the markets they have heretofore enjoyed. Furthermore, a point worthy of serious consideration is the fact that slaughter prices will not and cannot produce increased consumption sufficient to admit of calculation.

"Those lumbermen whose opinions are most sought are a unit in the firm conviction that permanency, with the least revolutionary adjustment of the necessary changes in trade conditions, can be accomplished only through organization. We have long since awaited the announcement that important interests on the Pacific coast had combined with some well-established Atlantic coast corporation or corporations, with the object of an intelligent disposition among an established clientele, of a large portion of Pacific coast shipments.

"It seems that almost every producer, large and small, is going in

'on his own hook,' and a great many so-called lumber salesmen are offering the stock. If added emphasis is needed to convince an individual that he is not a salesman, it is to be conscious that he has offered stock to a prospective buyer at a lesser price than the buyer anticipated paying. This fact is true in numerous instances of recent offerings of Pacific coast timber on this market when blanket prices of \$21 per M. delivered on dock this port, have been quoted, with buyer's privilege of making out a dimension specification in sizes and lengths to suit himself \$4 per M. in excess of this figure would suit the buyer as well and still equal or be under the quotations on competitive stock.

"Are the Pacific coast manufacturers not satisfied with the competition they have to meet in Atlantic coast stock, or is it their further object to cut every cent of possible profit out from under each other?"

"For more than half a century we have fought to maintain and advance the prices of lumber, but now venture to predict with a word of caution, that if the indecisive, haphazard, go-as-you-please methods continue (granting, of course, that any considerable volume of business is transacted) a lower range of prices will prevail in the eastern markets after July 1st than has been known in the last double decade. Co-operation is imperative if the evils forecasted are to be avoided."

There is no doubt that the views expressed by this New York

firm are held by many other eastern dealers. They contain a warning to the manufacturers of British Columbia, which—if they desire to make the eastern markets profitable and thus remedy the depressing trade conditions which have existed on the coast for many months, as a result of over-production and restricted demand—they must bear in mind very seriously. At the commencement of these greatly extended trade opportunities, it is of vital importance that the manufacturers of Pacific coast products should do their utmost to establish the trade upon a basis of reasonable profit, to which end co-operation on the part of coast manufacturers would be essential.

The importance of the opportunities which will develop, after the opening of the Panama Canal, has led the Forest Branch of the B. C. Lands Department to consider the opening of a branch office at Toronto for promoting trade in B. C. timber and its products. Mr. H. R. MacMillan, Chief Forester for B. C., visited Toronto recently in this connection and enquired into the wisdom of such a course. The result of his visit was that such a branch office will probably be established at once. The idea is to occupy an attractive, centrally located office where B. C. timbers and lumber and their products can be attractively displayed, and to gather information regarding trade opportunities which will be forwarded to the trade in B. C. An office of this nature would unquestionably exert an important influence in the direction of increasing the demand for B. C. products.

Anxiety Prevails Regarding Driving Conditions

The most important matter which is attracting the attention of the lumbermen of Ontario to-day, outside of the uncertain trade conditions which are prevalent, is the fact that from many parts of the province reports have been received that the quantity of water in the rivers of Northern Ontario is comparatively small, and that there is likely to be insufficient water for the drives. Whether this would be altogether an unmixed evil under present market conditions is a matter of dispute, but that it is unfortunate from the point of view of the manufacturer is unquestionable. There are still factors to be considered which may prevent low water. If plentiful rains come and if the thick ice, which still remained in the lakes at the end of April, does not all melt away gradually and be of no use to the drives, it is quite possible that there will be good driving conditions.

Always at this time of year a great deal of discussion and more or less anxiety regarding the drives develops and it often happens fortunately, that the results of the drives are much better than was hoped for. At present, however, there is much more anxiety on this

score than in former years. The results of the next few weeks are likely to have a very distinct bearing upon the market conditions which will prevail this summer.

Some of the conditions which are now feared, as involving bad driving results, were such as to make operating conditions in the woods more successful than usual last winter, and the output is reported not only to have been large, but to have been secured in some cases at very favorable costs. Under such conditions, with good driving, the quantity of lumber placed on Ontario markets this year would be large. This quantity would be increased also on account of the fact that last winter's severe storms blew down vast quantities of trees which have to be taken out of the woods to avoid destruction and to remove fire danger.

Taking conditions all round, there are more elements of doubt in connection with the outlook for this year's trade than in almost any recent year. If fine weather arrives soon and the drives are even fairly successful, much of this doubt will be removed.

Toronto Lumbermen's Club Making Progress

The plan for the formation of a Toronto Lumbermen's Club made considerable progress at a second meeting which was held on April 24th. Many of the most prominent members of the trade in Toronto were present at this meeting, and took part in the discussion which followed the holding of an informal luncheon. The upshot of the meeting was a decision to hold three informal luncheons during the following week and to start the club in this manner. After holding a number of these meetings, it will be possible to form a very definite opinion as to how the trade takes to the club idea, and as to the best methods for carrying it out.

The formation of lumbermen's clubs is a comparatively recent development in the United States and probably about a dozen successful clubs have already been formed across the border. These clubs have been successful from the outset. In some cases they have had for their chief object the development of a better feeling of fellowship among the members of the trade. This result has been secured in a remarkable degree. Members have found that they could count, in dollars and cents, the advantages which they secured from this better knowledge of one another. They have found also that the actual conditions under which they carried on their business were far more pleasant, when they had a more intimate acquaintance with the men with whom they were doing business.

Another object with some of the clubs which have been formed in the United States, is the exchange of confidential information as to the financial standing of customers. Whether this plan can be carried out in a club which is made up of wholesalers, retailers and manufacturers, is a matter of doubt, although it seems reasonable to assume that some approach to a plan of this nature might at least be made.

There are other objects than those which have been mentioned in connection with the formation of such a club, but they are of less importance and are of such a nature that they can be developed later on as a club grows, and begins to feel the necessity for increasing its activities and its usefulness. Various plans are carried out in the United States clubs for promoting the general interests of the trade. One of the most successful of these clubs holds frequent meetings at which important addresses are delivered upon matters of importance to the trade. The same means is adopted for bringing to the attention of large consumers, architects, contractors, etc., the proper uses to which various woods should be put. The interests of the manufacturers of native woods are thus promoted and foreign woods are more properly appreciated and their right uses made more general. One of the most important effects of work of this nature, on the part of the club in question, is that it has been able to secure the sympathetic understanding of the architects, and to educate them to a much better

knowledge of the proper uses of each kind of wood. Every now and then, this club gives a luncheon or a dinner, to which the architects are invited. An address or a discussion follows the meal. Good fellowship and a more efficient knowledge of the uses of wood are thus promoted.

There is so great a tendency on the part of business men of all kinds to allow the growth of their business to absorb so much of their time that their opportunities for meeting one another are continually being reduced. By forming and using a club this tendency is counteracted. Not only is good fellowship promoted, but by discussing trade matters with one another more frequently, the members obtain a far better knowledge of trade conditions than would otherwise be possible.

It is not presumed that Toronto's Lumbermen's Club will achieve all these results as soon as it is formed. But it is certain that they will commence to develop early; in fact they have already commenced to do so. The members have adopted a wise course in deciding to proceed slowly and feel the pulse of the trade before attempting to decide matters as the securing of permanent quarters and the determination of the amount of the fees. One of the most interesting features of the scheme, so far, is the fact that interest is being shown in it from outside points. Several members have already joined from large cities outside of Toronto, both in Canada and the United States. They realize that a central place of meeting such as a club would provide would greatly facilitate their business when in Toronto. It would also increase the importance of Toronto as a lumber market.

The Ontario Workmen's Compensation Act

An interesting letter upon the Workmen's Compensation Act for the province of Ontario, written by a prominent firm of lumber manufacturers in Eastern Ontario, is published on another page of this issue. The latest information available before going to press was to the effect that this bill would have received its third reading before May 1st, and for this reason the chief objects of the letter, which were to strengthen the opposition to the measure in its present form, and to prevent it from being enacted, cannot be achieved. The passage of the bill alters the whole situation, and now makes it incumbent upon those who desire to see the system of paying compensation to workmen for injuries, established upon a successful basis, to direct their efforts towards co-operating with all who are seeking to assist the administering commission which will be appointed, in coping with the difficulties which will inevitably arise under the act.

Previous articles in the Canada Lumberman have discussed the difficulties which the bill is likely to create. With the bill in the form of a law, it is probable that the correctness of the criticisms which have been made will be demonstrated and that the administering commission will need, and will welcome, anything in the form of con-

structive criticism which is offered. For this reason we hope that readers of the Canada Lumberman will look over the letter referred to above and also consult a few of the back numbers of this journal in which the question has been discussed, especially the issue of April 15th, and will then make their own views known. One of the best methods for doing this is to send a letter to us for publication. Such letters, appearing in our columns, will be brought directly to the attention of the government whenever they contain suggestions which are likely to assist. The whole question is one of the gravest importance to the lumbering industry, because the working out of the measure successfully will improve, a hundred fold, the conditions under which the industry is carried on, whereas, the bill, as it stands, contains elements which may be developed in such a manner as to place upon the industry a burden which many lumbermen will not be able to bear. The wide powers which are being given to the commission, to interpret, and even to alter the provisions of the act, place upon it a great responsibility, and the manufacturers of Ontario may render an important service to the province, at the same time protecting their own welfare, by showing a lively interest in the question.

United States Lumber Production

A report recently issued by the United States Census Bureau gives details of the production of lumber, lath and shingles in the United States during the year 1912. Reports from 29,648 sawmills show a total production of 39,158,414,000 feet as compared with 37,003,207,000 feet from 28,107 mills in 1911.

The State of Washington leads in quantity of lumber produced with a total of 4,099,775,000 feet and is followed by Louisiana, Mississippi, North Carolina, and Oregon in the order named.

On the whole, the report says, the showing for 1912 reflected improved conditions in the lumber industry. The total production was greater than in 1911 by 2,155,207,000 feet or 5.8 per cent. The reported production in Washington was the largest recorded since 1906. It is not improbable that in the near future, Washington will pass the record made by Michigan in 1890, when a production of 4,311,240,000 feet was reported.

Of the 55 woods manufactured into lumber, 14 were soft woods and 41 hardwoods. The soft woods contributed 78 per cent. and the hardwoods 22 per cent. of the total cut. Yellow pine supplied nearly one-half of the total output of soft wood lumber and, together with Douglas fir, white pine and hemlock, more than 5/6. Oak supplied 38.4 per cent. of the output of hardwoods and ranked third among all classes of woods.

The total production of yellow pine was 14,737,052,000 feet and Douglas fir which came second showed a total of 5,175,123,000 feet.

Hemlock lumber appears to have passed its greatest production, at least so far as the eastern species are concerned. It is not impossible that, when the western hemlock resources are fully developed the annual production may again rise until it approaches, if it does not equal the highest output in the past. The total production of hemlock was 2,426,554,000 feet.

The output of spruce lumber has been declining for several years, and in the east the decline may be expected to continue because all the principal sources of supply are now contributing and many stands are decreasing.

The production of the western species, may increase in response to the demand. The total production of spruce of 1912 was 1,238,600,000 feet.

The finest western pine is found in California on the western slopes of the Sierra Nevada Mountains, where trees 4 ft. in diameter are common and some are twice that size. The lumber production from this pine does not seem to be increasing. The quantity of valuable timber is very large, but the cut is limited by what the market will absorb. In 1912 the cut was 1,219,444,000 feet.

The production of shingles has declined slowly since 1909, and was smaller in 1912 than in 1908. Western red cedar, sawed most extensively in Washington, Oregon and Idaho, is the leading shingle wood and has supplied from 70 to nearly 80 per cent. of the total output each year since 1908. The production of shingles in 1912 amounted to 12,037,685,000 pieces.

The production of lath has shown a downward tendency during the past eight years and the figures for 1912 are the smallest for the whole period. The production in that year was 252,000,000 pieces smaller than in 1911 and 984,000,000 pieces below that of 1909.

The average value of all lumber cut in 1912, compiled from "mill-run" values was \$15.35 per M. feet. The average for softwoods was \$14.54 and for hardwoods \$18.25 per thousand feet. The average value for 1912 was 30c greater than for 1911, due to the rise in value of yellow pine, Douglas fir, white pine, oak, hemlock, and spruce, which together constitute nearly 77 per cent. of the total lumber production in 1912. The most expensive hardwood lumber in 1912 was tulip poplar.

Ottawa Valley Freight Rates Case Lumbermen's Club Making Progress

Railway Seek to Increase it from 5 to 6 cents per Hundred Pounds—Board Reserves Judgment

Ottawa, April 21; (Special to the Canada Lumberman).—Objection to the proposal of the railways to increase their summer export rates on lumber, from points throughout the Ottawa Valley to Montreal, was voiced before the Railway Commission today; on behalf of the lumbermen interested, by Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association. After hearing some discussion, the Board decided to reserve judgment. Meanwhile the increases, which were to go into effect on May 4th and May 6th, are suspended.

When the case was called Mr. Hawkins said the lumbermen would like to have an explanation of why the railways propose to make the increase.

"It comes down to a question of whether the railways have a right to disregard water competition?" said Chief Commissioner Drayton. "Are you willing to disregard water competition?" he asked of E. P. Flintoff, counsel for the C. P. R., and the answer was in the affirmative.

Mr. Hawkins informed the board that prior to May, 1908, the summer schedule of rates on export lumber was four cents per 100 pounds and five cents per 100 pounds domestic rate from Ottawa Valley points to Montreal. In May of that year both rates were increased to five cents, or an increase of 17.36 per cent. Now it is proposed to advance the export tariff to six cents, making a total increase since prior to 1908 of 36.42 per cent.; and this without even the usual thirty days' notice, for the notification of the latest increase, to go into effect early in May, was given only on April 20th. Not expecting the six cent rate to go into effect, lumbermen had done business on the basis of the five cent rate and consequently stood to lose heavily if the railways were allowed to act as they desired.

Mr. Hawkins was supported in his argument by Mr. J. C. Walsh, tariff expert of the Canadian Manufacturers' Association, and Mr. W. S. Tillston, representing the Montreal Lumbermen's Association.

Mr. Flintoff sought to show that there was nothing radical or harmful in what the railways proposed to do, but admitted that they were actuated to attempt to make the increase by the fact that water competition between Ottawa and Montreal had practically disappeared.

On April 15th the domestic rate was increased from five to six cents per 100 pounds. The winter rate is seven cents. Whether the board will decide to cancel the recent increase in the domestic rate remains to be decided.

Already at Work on Toronto Harbor Timbers

Mr. C. C. Yount, general manager of the Empire Lumber Company, from the large timber holdings of which, at Cowichan Lake, Vancouver Island, the timber will be secured for the Harbor works at Toronto, is now busily organizing his staff at Victoria, B.C. In a recent interview upon the subject, he said:—"We are already at work in the execution of our contract for supplying timber for the Toronto harbor works. At present we are employing a staff of 200 men at the scene of operations at Cowichan Lake. These men are getting out the big timbers which are forwarded to Genoa Bay, where the mill of the Cameron Lumber Company cuts it to the required dimensions. We have experienced some difficulty in getting sufficient cars to meet our present needs, but this disability will, we expect, be overcome very shortly. We purpose installing more logging engines just as soon as the season is a little more advanced. The order for these engines has already been placed.

"The contract calls for the delivery of 24,000,000 feet of timber. At first we shall ship over the C. P. R. as fast as the timber may be required at Toronto, but we purpose shipping mainly through the Panama Canal. The canal, we understand, will be available for use on July 1, next. I have the personal assurance of Colonel Goethals to this effect. It will not formally be opened for general traffic until January, 1915. As to our projected large mill at Crofton, I can only say that we stand ready to take this work in hand just as soon as the business outlook warrants such a large expenditure. All our plans have been perfected, and it is now entirely a question of business judgment as to the appropriate time for making a commencement."

Speaking of the effect on the Pacific coast section of the continent of the opening of the Panama Canal, Mr. Yount was strongly of the opinion that it could not fail to have a profound effect on the development of the entire country. Reducing by one-half the distances of the water-carrying routes of the world, could not, in his opinion, fail to alter the face of things generally and bring about a stimulus in development, heretofore undreamed of. Mr. Yount added that he was confident that President Wilson's plea for the repeal of the clause exempting American ships from canal tolls would pass the Senate.

Toronto Trade Discuss Details and Arrange for Three Luncheons at Which to Draw up Further Plans

Arrangements for the formation of a lumbermen's club for Toronto were materially advanced at a meeting at the Prince George Hotel on Friday, April 24th. There was a good attendance, and, after luncheon had been disposed of, those present adjourned to a private room to discuss the proposed club. Mr. J. L. Campbell, of Campbell and Johnson was appointed chairman of the meeting. The proceedings of the first meeting which was held on Friday, March 13th, were explained and a discussion ensued as to the best manner in which to start the club.

A committee which was appointed at the previous meeting to look into the matter of securing quarters reported that, for three days in the week, good accommodation could be secured for luncheon at the Dorothy Jane Tea rooms in the Yonge Street Arcade where luncheon would be served and a private room reserved. Adjoining this room is a smoking room which members would also be able to use. The dining room would accommodate about fifty people.

A lengthy discussion then ensued as to the manner in which the club should be started, whether regular days in the week should be set aside for luncheon at some convenient restaurant or lunch room, or whether a regular club should be formed in the first place, with permanent quarters.

Mr. W. J. Lovering, in discussing this, said that he believed the best method would be to hold two or three luncheons a week during the first month or so and discuss matters in an informal way. It would then be possible to settle their plans much more definitely and they would see whether arrangements for permanent quarters or daily luncheons would be feasible.

Several members discussed this matter and some were in favor of holding luncheons daily from the outset. The general opinion, however, was that, for the first few weeks the meetings should not be so frequent, but that two or three in a week would be sufficient.

On motion by Mr. Jas. Lauder seconded by Mr. Lovering, it was decided to hold the meetings three times a week at first, with a view to having more frequent meetings as soon as feasible.

Mr. G. W. Boake, who was one of a committee appointed at the previous meeting to secure members reported that 29 members had already joined and paid the provisional fee of \$10. He had also a list of 60 other names which would be canvassed as soon as possible.

A discussion followed as to the membership in the club, the question having arisen whether one membership would include all the members of a firm or whether membership should be considered as individuals. It was the general opinion that if a permanent club with various club privileges were formed, the membership should be individual. It was also thought that, from the outset, the individual membership idea should be adopted, although, at present, if any member desired to bring travellers belonging to his firm, or his partners to the luncheons they would be welcome. A short discussion also took place upon the question of fees and Mr. Boake reported that the provisional fee of \$10 was generally considered to be quite reasonable, no objection having been made to it. The final disposition of this matter was postponed until some subsequent meeting when the plans for the formation of the club have become more definite.

A motion was then carried that a notice should be sent out to all the members of the trade in Toronto to the effect that three meetings would be held during the following week. The meeting then adjourned.

A Market in England for Canadian Wheels, Spokes, Etc.

The Canadian Trade Commissioner at London, Eng., in a recent report says:—"Having been requested to ascertain the prospects existing at the present time in the United Kingdom for Canadian wooden wheels and accessories, such as hubs, rims, spokes, shafts, etc., inquiries have been instituted among leading representatives of the trade. One of the most striking features disclosed by this investigation is the gradual and steady falling off in the use of wooden wheels as the direct result of the growing popularity of motor-propelled traffic. Upon general lines, the principal wooden wheels which are now used to any considerable extent in England are those connected with large drays, wagons and vans, and quite small vehicles, such as milk barrows, etc., and the former, the large wheels, are almost exclusively manufactured in this country, although spokes and certain other component parts are frequently imported.

"Under these circumstances there has been a large decrease in the importation of wooden wheels generally. These came formerly almost wholly from the United States, but the fact that the increased demand for American wheels in the home market has reduced the quantity available for export almost below the demand still left in the United Kingdom, with a rise in prices, would cause a fair opening for Canadian wheels were it not that latterly Sweden has taken a hand

in the business, and is at present sending certain varieties of small wheels into this country at prices stated to be 15 to 20 per cent. below current American quotations. All the same, there appear to be several firms in the London district who are prepared to import from Canada certain varieties of wheels, for the disposal of which they have a connection, provided that satisfactory arrangements can be concluded for regular supplies.

"As regards spokes and hubs, the outlook is distinctly more favorable, and it would seem that considerable quantities can be placed over here, if Canadian manufacturers are prepared to sell at competitive prices. Oak spokes are in greatest demand, but hickory is used to some extent. In this connection it should be noted that the spokes required are of English pattern, which differs essentially from what is known here as the 'American' type, the kind mainly used in Canada, and any Canadian manufacturers taking up the business would have to adopt the English pattern, because others are practically unsaleable here. For a similar reason, many of the goods made by Canadian manufacturers, being destined for vehicles which are unknown in Great Britain, could not be sold here under any circumstances."

Canadian Maple Rollers in England

During the past season of St. Lawrence navigation, 1,315 bundles of these blocks reached Manchester by direct steamers from Montreal, and 364 bundles and 14,543 single roller blocks during the preceding St. John and Halifax season.

The general run of sizes is as follows: 26-in. x 6½-in. diam., 26-in. x 5¾-in. diam., 22-in. x 6½-in. diam., 22-in. x 5¾-in. diam., with a small percentage of smaller sizes.

The blocks are octagon shaped, and should be made from hard rock-maple, sound, free from knots, shake and splits, and evenly manufactured, and the ends should be painted or tarred.

Canadian exporters should be getting more of this trade and the Trade Commissioner at Manchester reports that he would be pleased to put them in touch with importers in the district.

How Can Small Walnut Pieces be Used?

The large quantity of waste lumber produced in woodworking establishments, especially those which use the more valuable varieties of lumber in the manufacture of furniture, etc., presents a problem which is becoming rapidly more important, with the advance in the cost of producing the lumber itself. An extensive Toronto manufacturer of furniture has found it necessary to get rid of material of this nature, even at a loss, so as to prevent it from accumulating. Large quantities of valuable wood, such as high grade walnut, are included in the waste and he would like to get into touch with firms who could make use of this wood in small pieces.

Enquiry recently made of the Forestry Branch of the Department of the Interior at Ottawa brought the following reply:—"The solution of any such problem depends on so many factors that a general statement would be of little or no value. Much would depend on the size of the waste. It is often the case in the utilization of small pieces, even of valuable woods, that the cost of handling, sorting, cutting, etc., is prohibitive. Many woodworking machines are designed to take raw material of certain dimensions and the cost of reducing the waste to these dimensions often exceeds the saving accomplished in using waste instead of large sized lumber. Small waste pieces of walnut can be used in making boat and canoe trimmings, small wood carvings, gun, pistol and air-gun stocks and fore arms, bases for small pieces of electrical apparatus, telephone boxes, battery boxes, blocks for cuts and engravings, built up billiard cues, brush backs and handles, tool handles, clock cases, parqueting flooring, knobs for drawers, auto trimming, small patterns, bungs, brackets, gavels, stereoscopes, picture frames, tennis racquets, and innumerable small novelties and toys.

"Whether or not the manufacture of any such commodities from waste would be profitable in this particular instance is another matter. The size of the pieces is perhaps of first importance, then the cost of manufacture must be considered and a market for the products assured. If the manufacturer would write to this branch, giving full details as to size of waste, we might be able to give him some further suggestions."

Any readers of the Canada Lumberman, who can furnish information upon this subject, are requested to write to the Editor.

In the Ontario Legislature recently, the opposition asked for information regarding the quantity and quality of the timber on the townships of Thistle and McWilliam which were recently sold. The government declined to make the information public, claiming that it was contrary to precedent to do so, and that it might affect the interests of the purchasers, in case they wished to sell the property at some later date.

Death of W. T. McLaurin of Montreal

Montreal, April 20th (Special to the Canada Lumberman): Mr. W. T. McLaurin, a prominent retail lumber dealer of Montreal, died on April 17, after a week's illness from pneumonia. Mr. McLaurin, who was 53 years of age, belonged to a family with long associations with the lumbering trade, and was engaged in the business all his life. He was a native of East Templeton, P.Q., but spent several years in Manitoba, afterwards going to Kansas. On returning to Canada he became interested in the firm of McLaurin Bros., Montreal, and later started the McLaurin Lumber Company, whose yards are on St. Catherine Street East. Mr. McLaurin was past master of Mount Moriah Lodge A.F. and A.M.; Past District D.D.G.M.; Past Z., Montreal Chapter; Past Preceptor, Richard Coeur de Lion, 32nd degree Scottish Rite; a member of the Mystic Shriners; vice-president of St. George's Snowshoe Club, and a member of the Caledonia Curling Club for twenty years. He is survived by a widow, two daughters, the Misses Bernice and Clarissa McLaurin, and three brothers, Mr. Alex. MacLaurin, of the Charlemagne and Lac Ouareau Lumber Company, Campbell-McLaurin Lumber Company, and other lumber companies; Mr. L. K. McLaurin, of McLaurin Bros., Lachine, and Mr. John R. McLaurin, of Ellsworth, Kansas. The remains were followed to the graveside by hundreds of prominent masons and business men of Montreal.

What Constitutes a Good Yard Manager?

The successful management of a retail lumber business is a bigger job than the average lumber dealer realizes. Yet when you stop to consider that a well stocked retail lumber yard represents an investment of \$10,000 to \$15,000 and sometimes more, is it any wonder that it requires a big man mentally to manage it successfully—a business man in the fullest sense of the word? says a writer in the American Lumberman.

The great trouble with the lumbermen, and especially is this true of the yard managers for line-yard concerns, is that they have not been educated for retail lumber merchandising. I will venture to say that not one in ten could intelligently explain how shingles are made, tell what a gang saw is, or what raw materials are used in cement and the process of manufacturing it. Yet they handle and sell all of these commodities every day. How many know why plaster in summer time, when it is a little old, works "short," as the masons say, and know what to do to remedy it? These are only a few of the many commodities that the lumberman handles and of which he should have a thorough knowledge.

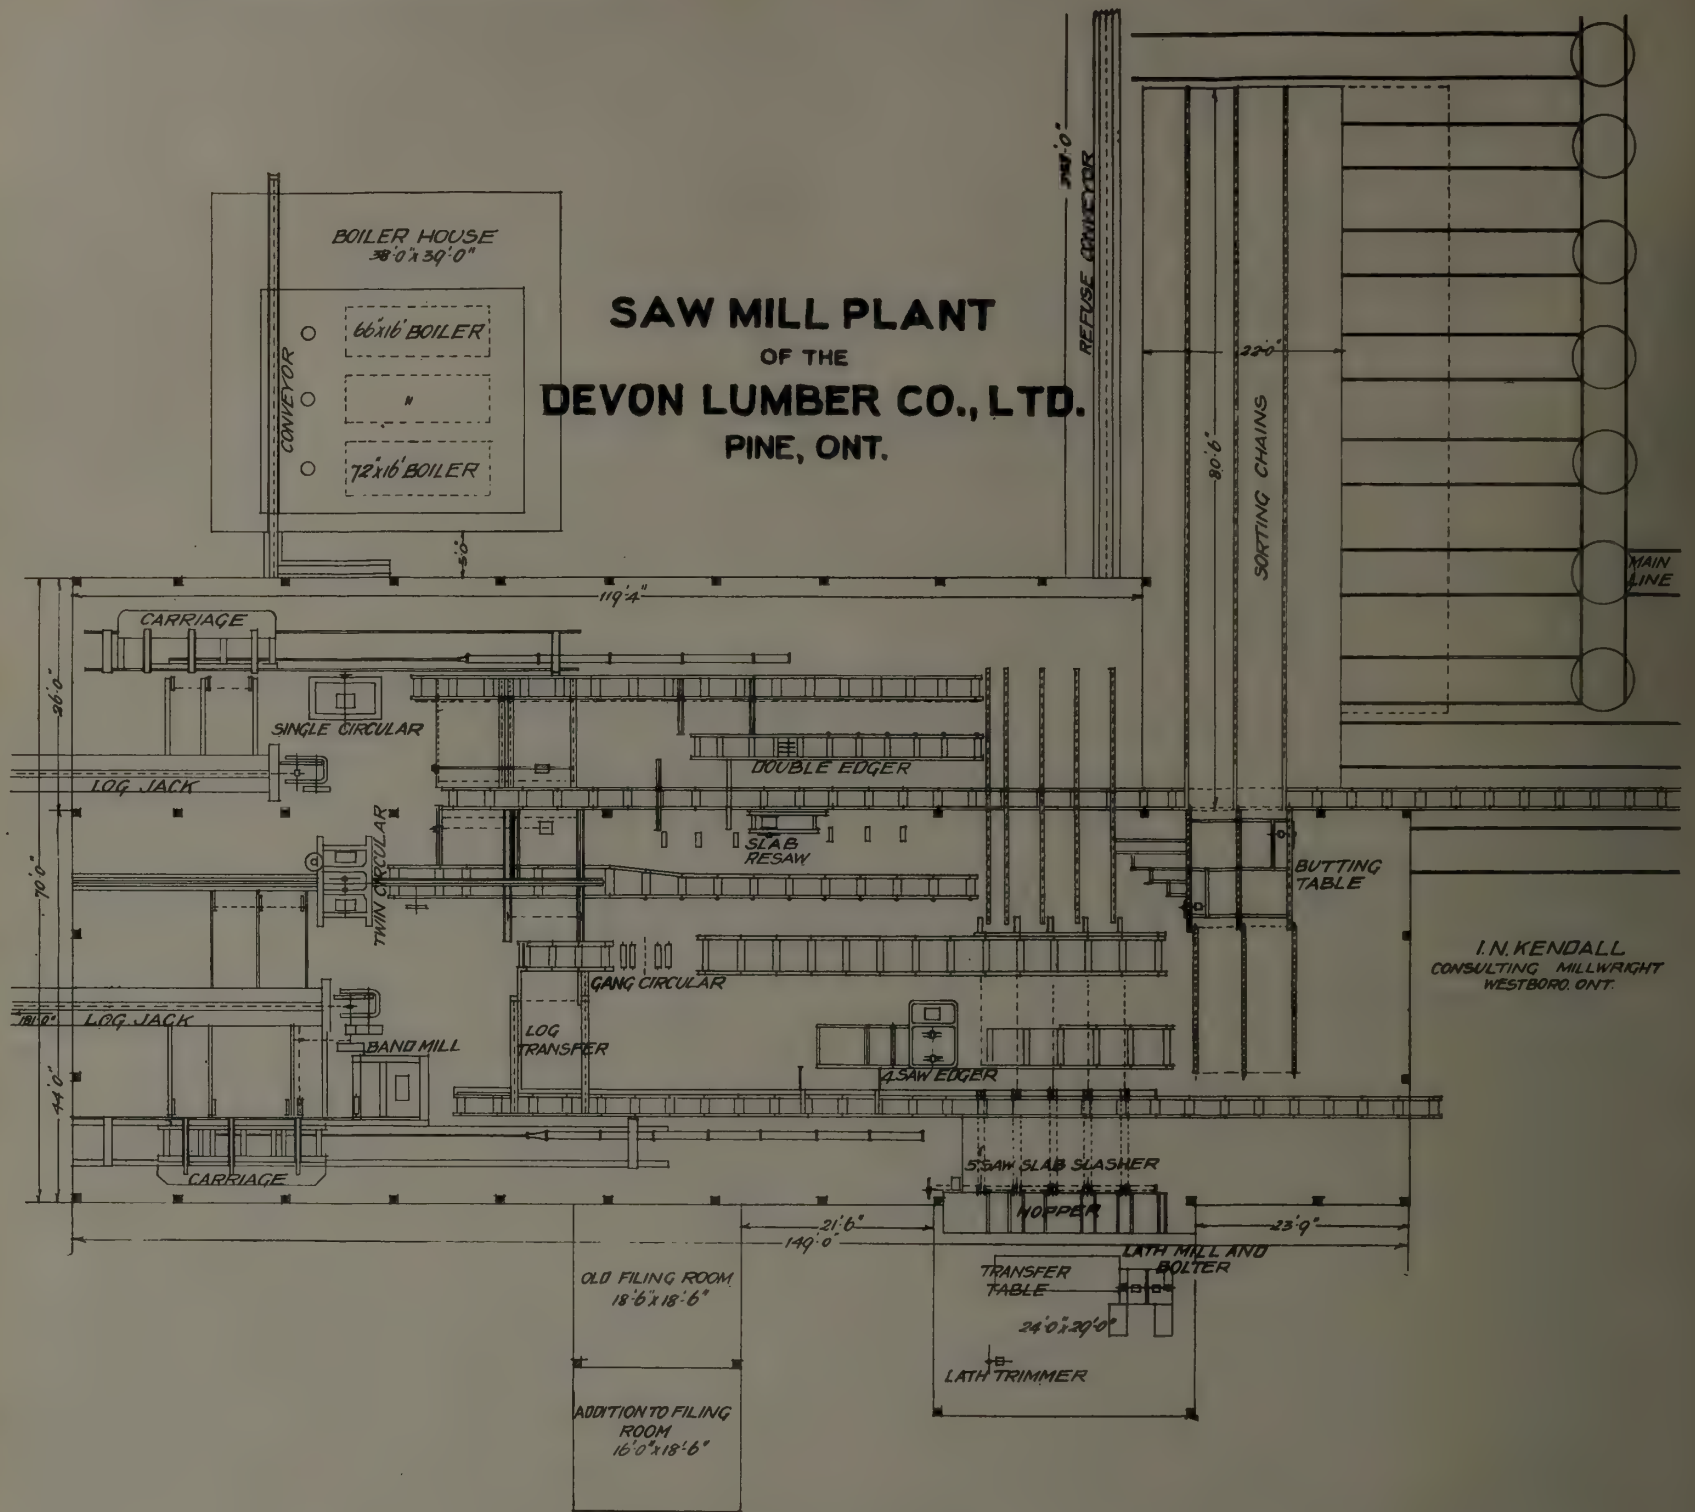

A well stocked lumber yard handles practically all the materials necessary for the construction of a building, and the successful manager should be familiar with plans and specifications, and if necessary should be able to take off from the blue prints a list of materials required for a building. In fact, he should be so familiar with the building business that his trade would come to look upon him as an authority on construction, and come to him for advice before building, which would give him a decided advantage in securing the order for the bill.

A good yard manager must also be an all-round office man. By that I mean he must be a good credit man so that he can intelligently decide when to grant credit and when to ask for the cash; and having sold for credit he must be a good collector, for no matter what his profits may be, he has not secured them until he has collected his accounts. He must also know enough about accounting to keep his books not only correct but in such shape as to know which commodities are making him money and which commodities he is selling at cost. Most important of all he should be able to know and understand the relation his expense account bears to his sales and gross profits.

He should subscribe to several good trade journals covering the lines that he handles so that he could keep abreast with the times and know what other successful dealers are doing. It is one of the laws of nature that everything runs in the course of least resistance, and if he does not keep himself keyed up to the highest possible pitch he will soon run down and get in a rut.

These are only a few of the good points that a retail lumber dealer should possess and to many it may sound rather theoretical, yet it is a well-known fact that the man who knows and understands his business is the man who is making a success of it, and as this is an age of specialists the lumberman or the yard manager who is going to make a success for himself and his yard must specialize in retail lumber merchandising.

Wm. Milne & Sons, of North Bay, report conditions bright for operations this season. Their mills have started cutting, and they will cut four million more from their own logs this season than they did last year. They anticipate no trouble with their own drives.

Plan of tracks and piling grounds of the Devon Lumber Company, Limited

Important Addition to Ontario Mills

Devon Lumber Company Starting Fine New Mill Near Chapleau, Ont.—Capacity 125,000 feet per Day—Description of the Plant

F. N. McRae, M.P., President.

About four miles east of Chapleau, Ont., the Devon Lumber Company, whose head office is at Ottawa, Ont., are commencing saw milling operations this year, on a large scale, at a splendid new sawmill which they have recently erected. In its equipment, shipping facilities and large stock of excellent raw material in the form of timber on the company's limits, the Devon Lumber Company have a combination which is certain to place them immediately in the front rank of Ontario lumber manufacturers. The post office address for the sawmill is Pine, Ont.

The new plant which has been designed with a view to the most economical and efficient production of lumber, has a capacity of 125,000 feet per day. The output will be white, red and jack-pine.

lumber. During the present year the company will manufacture between twelve million and thirteen million feet, mostly white pine, about six million lath and over two hundred thousand railway ties. As will be seen from the accompanying illustrations, the layout of the plant has been planned in a manner entirely in keeping with the most modern principles of sawmill practice, under the direction of I. N. Kendall, Westboro, Ont. Each element of the equipment is advantageously located and, from the entry of the logs to the exit of the finished product, every operation is carried on with the least possible expense and the greatest possible efficiency and simplicity. The equipment includes a double cutting band saw, a circular gang, which is noted for its smooth running and the uniformity of the lumber which it produces, twin circulars for making ties and slabbing, a lath and shingle mill, and all other machinery that is necessary to complete an up-to-date mill of this kind. In order to keep the plant running to full capacity, two log-jacks are provided, one for each side of the mill.

Being located on the main line of the C. P. R. at Devon Station, Ont., the company obtains a fair freight rate into all the large consuming centres in Ontario, Quebec and the Northern part of the State of New York.

The Devon Lumber Company's yard is located about three-quarters of a mile from the mill and is connected with the mill, as shown by the illustration, by the railway line. All the lumber is handled from the mill to the piling yard by locomotive and lumber lorries. The plans of the mill and yard show that the layout is one of the most up-to-date in Northern Ontario. These illustrations explain the layout better than could be done by any description.

Next winter, it is possible that the Devon Lumber Company will haul all their logs by a steam log-hauler. All their operations in the

woods are carried on under the most advanced methods and they are now enquiring into the log-hauler problem, with a view to rendering their woods operations still more efficient. Although the company started their operations last fall, about two months later than is customary, and did not cut a single log until the first day of December, they made an excellent record, putting 250,000 logs on their log dump and completing their operations by the 17th of March.

One of the half-tone illustrations shows an interesting part of the company's operations, where they are bringing their logs out, against the run of the water, over a very steep hill, by steam hoist. Another half-tone shows another method of overcoming log-hauling difficulties. It represents an extensive cut which the company made through a hog's back of land in order to connect up two spring lakes.

The president of the Devon Lumber Company is Mr. F. N. McRae, the well-known lumberman of Sherbrooke, P.Q. Mr. W. B. Bartram of Bartram Bros., Limited, Ottawa, Ont., is managing director. The other members of the company are G. F. Hodgins, Shawville, P.Q.; T. A. Low, Renfrew, Ont.; and Colin M. Bartram, of Ottawa, Ont.

Bartram Bros., Limited, Ottawa, will be the sales agents for the company. Mr. W. B. Bartram, director and general manager of the Devon Lumber Company, Limited, is also president and general manager of Bartram Bros., Limited, Ottawa, Ont., wholesale lumber dealers.

Frank N. McCrea, M.P. for Sherbrooke, P.Q., who is president of the Devon Lumber Company is one of the most widely known and successful lumbermen in the province of Quebec. He is connected with the following companies in addition to the Devon Lumber Company:—Brompton Pulp and Paper Company, East Angus, P.Q.; Sherbrooke Lumber Company; Etchemin Lumber Company and Nicolet Falls Pulp and Paper Company, in each of which he occupies the position of president. He is also vice-president of the Lotbiniere Lumber Company, Lyster, P.Q., and of the Chaudiere Lumber Company. In addition to these Mr. McCrea occupies the position of president of the Stanstead & Sherbrooke Fire Insurance Company and of the Megantic Lumber Company. Mr. McCrea was born on a farm in South Durham, P.Q. His first business venture was in the hemlock bark trade which soon led him into a connection with the timber trade, from which his business activities brought him also into touch with railway enterprises and the pulp and paper business.

W. B. Bartram, Managing Director.

Overcoming a Steep Haul by Steam Hoist—Devon Lumber Co.

Heavy Cut to Facilitate Hauling—Devon Lumber Co.

One of Mr. McCrea's largest and most successful business transactions was the acquisition of the Lotbiniere and Lake Megantic Railway and its lands from King Bros. At the time, this transaction was generally considered a risky one for Mr. McCrea, but he saw further ahead than did his friends and the outcome was a profitable one. Subsequently, Mr. McCrea purchased the assets of the Royal Pulp and Paper Company of East Angus, P.Q., and merged this undertaking and property with the Brompton Pulp and Paper Company. In public life Mr. McCrea has not only taken an active interest in Dominion politics, but also in municipal affairs. For a time he was Mayor of Durham, P.Q., and after moving to Sherbrooke was elected an alderman of that city.

Workmen's Compensation in Ontario

An Open Letter to the Legislature of the Province From a Lumber Manufacturer—Unjust Provisions Outlined

To the Legislature of Ontario: Snow Road, Ont., April 24.

Permit us to make through you, the representatives of the people of Ontario, our most earnest protest against the passage of the proposed "Meredith Workmen's Compensation Act." If we interpret its provisions correctly this enactment is one of the most unjust, iniquitous and socialistic measures that have ever been presented for the consideration of the provincial legislature in the history of the province. Inasmuch as it abolishes all common law rights, thus revolutionizing common law practice, and in its stead places in the hands of an appointed commission, **absolute and arbitrary** power without redress or appeal, making the commission the first and final arbitrator to award whatever compensation it may see fit, within certain limits, against an employer, in favor of an employee, such a law is peculiarly **dangerous** to the State. It degrades citizenship by placing dishonesty, fraud and crime at a premium, inasmuch as it imposes upon the employer the liability of paying an injured employee for life, 55 per cent. of the wages received at the time of injury, whether such injury was caused by his own carelessness, by his own wilful neglect, by purposely self-inflicted injury, or by any of these done by his associates. Should such injury result in death, the widow receives like compensation for life, or until she marries again. Our understanding is, that if two or more employees should quarrel during working hours, such quarrel resulting either in disability for life, or in death to one or more of them, the same liability would fall upon the innocent employer.

If, instead of placing this burden on the individual employer, the bill placed it on the provincial government, or better, upon the Federal or Dominion government, where all such charges properly belong, the measure would still be the direct means of causing and fostering fraud and crime on the part of our working classes, and, for this reason alone, would be against the public welfare. We do not believe that the voters of the province of Ontario, or the workmen themselves would support this bill. We have yet to learn of a workman who favors it. Our workmen here have sense enough to appreciate that whatever cripples their employer is against their own interests. I find, in talking with other employers in the County of Frontenac, that their men feel the same way. If we are correct in this statement why should the government vote to impose upon one class of citizens such a burden which would necessarily drive many out of business?

The act is one of the most glaring examples of class legislation ever brought before a legislative body, inasmuch as the large railways (having been built to a great extent, if not wholly, at the public expense, and who fight their employees claims to the highest courts) afford the only excuse in Canada for a workmen's compensation act. Yet these railways, among other certain classes of employers are exempted from liability by the provisions of the act.

Some employers can shift this burden upon the consumers of their product and thus raise the present high cost of living still higher, resulting in hitting hardest the working men, whom the act is intended to benefit most. Unfortunately for the lumberman, owing to strong competition from other provinces where labor is cheaper, as well as to the free trade policy of the Dominion in reference to lumber, which permits world-wide competition, he cannot shift the burden. In the lumber business particularly, such a law would work the greatest injustice and hardship and we sincerely believe that it would be the means of driving many, if not all, of the small lumber manufacturers out of business. The lumber business is not conducted in Ontario by large corporations. Its management and conduct is, as it always has been in this province, in close touch with its employees, and therefore has no need for laws which are intended to curb only large modern corporations. For this reason lumber manufacturers should be exempt from the provisions of such a bill. The same is true of a large majority of employers in all lines of industry in Ontario. In fact, scarcely any class of employers, in the province,

except the large railways affords any reason or excuse for such drastic legislation.

This bill is the result of the appointment of a one-man commission. While we have the highest regard for the legal ability of this commission, we believe better results could have been obtained by a commission consisting of two or more of the most practical business men in the province.

The definition of "manufacturer," as given in the preliminary section of the bill, is vague and indefinite, not pointing out clearly the boundary line between the different classes of employers, and, except for the arbitrary powers given the proposed commission or administrative board, would involve endless trouble, annoyance and litigation in distinguishing the proper classification of employers. In fact, it would puzzle a Philadelphia lawyer to find anyone to whom the definition of "manufacturer" will not apply. This bill is full of similar impossibilities which make it absolutely impracticable. The fact is, this measure deserves much more careful consideration than appears to have been given to it.

In our judgment, any compensation act intended to reach the employers whose past action has made such legislation at all worthy of serious consideration, should be Federal, not Provincial, for the reason that the railways and other large corporations do an inter-provincial business and are necessarily beyond the control of provincial laws. The burden of all such paternal laws **should fall on the public at large**, not on any individual, or class of individuals, not even on a single province. The principle upheld by this bill, that the burden should be lifted from the public at large and thrust upon the industry and the consumers of its product, is fundamentally wrong. The highest purpose of all good laws is to foster and encourage industry and thrift. Paternalism never encourages thrift or industry, because it affords no reward to individual effort.

This bill discourages the employment of labor by throwing unjust burdens upon the employer. It discourages thrift and effort on the part of the employee because it rewards him for getting rid of honest work by purposely disabling himself.

For all the above reasons, and many more, which would take a great deal of space to enumerate we respectfully urge that the proposed "Workmen's Compensation Bill" should not be passed.—The Chandler-Jones Lumber Company.

Keeping Tab on Car Movements

Lack of system is one of the most generally noted faults in the offices of lumbermen the extent of whose business is sufficiently great to suggest the adoption of reasonable methods of preventing errors and loss.

Cases are on record of cars being shipped out without a proper record being made and without an invoice being sent to the customer. These cases have been uncovered by accident. There are plainly many others, not located, which have been handled in this way, to the material loss of the lumber company.

If a business is small, and if the owner of it is on the job all the time, the chances of serious errors are slight; but when the concern has grown to such a point that the memory of the head of the establishment cannot contain all of its details, the opportunity for loss is considerable.

A leading wholesale hardwood concern has recently adopted a checking system for keeping tab on cars, which seems to be worth general adoption. The system is used in connection with shipments from its local yard, and also with reference to shipments from the several mills which it is operating. The plan has the advantage of simplicity, and yet seems to provide an absolute check.

The basis of the record, of course, is the tally. Turning in the tally of the inspector is followed by making out a shipping ticket, in duplicate, containing the results of the tally. These shipping tickets are numbered consecutively, consecutive numbering, in fact, being the basis of the entire system.

The sheets of the salesbook are also numbered, its numbers corresponding with those of the shipping ticket. The entry in the salesbook, in addition to containing the facts shown on the shipping ticket, likewise indicates the price at which the lumber was sold, and the books of the concern are posted from this record.

In the case of the local yard, the duplicate of the shipping ticket is not needed particularly, but where the shipment was made from a distant mill, the duplicate is kept on file at the mill for the information of the superintendent.

The bill of lading is issued in triplicate, as usual, and the car number and other information are entered in a book used for that purpose exclusively. The entries are numbered, the numbers corresponding with numbers printed on the bill of lading itself.

This is the entire system. Now let us consider how it works and what conditions it is calculated to take care of. In the first place, the use of consecutive numbers furnishes a "flag" or warning by which any lost or omitted record can be indicated. For instance, if the per-

son in charge of the salesbook notices that one number is missing, the local yard or the outside mill, as the case may be, is called on to supply the missing number.

On the other hand, the salesbook is checked against the bill of lading book, and it is determined that an entry for the salesbook; which, remember, is the basis for the ledger charges, has been made to correspond with every car shipment indicated by the bill of lading book. The use of the consecutive numbers on the latter insures the proper entry of every car, for in the event of failure to turn in the bill of lading used for this purpose, its absence is immediately noted. The use of consecutive numbers and duplicates means that a lost record will be noted, and that it can be rewritten without inconvenience.

Another feature of the bill of lading book which is worth noting is that provision is made for handling shipments which are not made in the routine way. For instance, if a car of lumber is purchased at one point, shipped to another for drying and then reshipped direct to the consignee, there is a possibility of the record being incomplete and inaccurate by reason of the tie-up at the kiln, or the suspension for any reason whatever at any other point. To take care of this, the bill of lading book, containing the car number and other information, carries a special indication that the movement is incomplete, and that a further record must be made of its final disposition. This prevents the item from being lost track of, and insures attention being called to the status of the situation.

The head of the concern which has adopted the system referred to said that the checking arrangement was not made simply because of a craze for "system," or to introduce red tape into the office. He explained that actual experience had demonstrated the need of some such protection, and that it was furnished for that reason only.

"We know of two cars which got away from us prior to the time we put this system into use," he said. "One we located because the customer wrote to make a complaint about some feature of the shipment. That called attention to the omission of the record and enabled us to get trace of it. In another case the customer was simply honest enough to call our attention to the fact that no invoice had been sent, enabling us to make an investigation and determine the car which had escaped the proper record."

"Take the bill of lading question, for example. No car is shipped without a bill of lading being made out, of course; but when unnumbered pads are used, it frequently happens, or at least can easily happen, that in case of a 'jam' in the office, someone will hurriedly make out the bill without referring it to the proper party for entry. The result is that the car is sent on with no record behind it. This cannot happen under our system. Then again, tally-sheets may become lost and no salesbook record be made. In that event the entry in the bill of lading book gives us the clue and enables us to ascertain the information we need."

"It might be supposed that the introduction of a system of this kind has been accompanied by an increase of work. On the other hand we have found that in most cases it has cut down the amount of labor required. Heretofore frequent copying, by hand, was necessary to have the proper records made. Now, with a loose-leaf system installed, the facts can be written on the typewriter, copies made at the same operation, and time and labor saved. It must be remembered that the smaller the number of clerical operations, the fewer the chances for mistakes of that kind to be made."

Another feature in connection with the checking operation is keeping tab on wagon business. In the big wholesale yard or sawmill, where carload business is the principal item, wagon hauls are likely to be overlooked if close attention is not given them. Even in retail yards, where wagon business is the only kind of trade handled, it is well-known that unless a systematic method of checking this business is provided for, wagons will get out without being recorded and the lumbermen will be able to make no charge.

For this reason it is desirable that the same sort of record, in general, be used for wagon-load hauls as for carload movements. That is to say, a ticket, in triplicate, with consecutive numbers appearing, should be used. The yard office man of course keeps one of the tickets; one is sent to the customer with the wagon, and the other goes to the office. Here again the simplicity of the scheme and the fact that the tickets are consecutively numbered operates to call attention to an omission.

It is possible, of course, for a careless driver to leave without thinking to get the ticket, or for a careless clerk to wait until all of the loads intended for a certain customer are sent out, before making up the tickets; but if the concern insists on every wagon being ticketed, and if the customers become accustomed to receiving a ticket for each load—an arrangement which is a protection to them as well as to the seller—arrangement will soon become a matter of routine to everybody in the yard, and will be taken care of accordingly. The systems referred to have been designed for the purpose of preventing innocent mistakes, but would also serve as a check on dishonest employees.—G. D. C., Jr., in *Hardwood Record*.

Dimension Stock Essentials

There are about the same number of essential factors to be considered by the man who would succeed in the dimension stock business as in any other special line of woodworking. To succeed best he should show due regard for all of them. It is not the purpose of this paper to go into details relative to all of these features but there are a few things that may be overlooked because they do not appear to be essentials, and it is hoped to draw the dimension man's attention to such points.

A prime essential in the dimension business is smooth work with the machines to the end that the stock may present the appearance of quality. If the stock is cut roughly, thick in some spots, thin in others, and with corners out of square, it will not appeal to the buyer even though it be cut from the best of timber. This means that the very appearance of the stock through careless manufacture may detract enough from its value to spoil the chances for profit in the business.

It is an undeniable fact that appearance counts for a great deal even in lumber, and the more lumber is cut into special sizes the more opportunities there are to make or mar good appearances. Rip saws should be as carefully filed and set as for doing cabinet work, so that instead of ugly saw marks that must be planed out, there will be a clean surface that a very little cut with a planer will make smooth. Saws kept in excellent condition will do enough more work to pay for the extra pains taken with them.

The band rip saw is a good machine to use in a dimension plant. Usually more pains are taken to keep it in order—it just naturally begets a higher order of mechanical skill—and besides it takes out less in kerf. It might appear that this does not amount to much in ripping up lumber and flitches, but by just a little figuring the dimension man will find that there is as much saving of kerf timber with thin saws in dimension work as there is in sawmilling. He should talk with the band saw people; they will give him the figures and the argument on this point. And then, whether he is using band or circular rip saws, he should see that they cut smoothly. It will pay, and it may mean the turning of the balance for or against success.

Another thing; when an order for dimension stock is received it should be filled exactly according to specifications. While this injunction is being given there comes to mind a pertinent instance. A millman had an order for chair-rung stock of a certain size and length. He cut it to size, but concluded that any multiple of the length would be satisfactory. So some was exact length, some double, some even four lengths. When the purchaser received it he deducted from the invoice so much per thousand for cross-cutting those of multiple lengths, and also some for trimming to exact length part of the stock that was cut single with too much spare length left on the ends for the stock to work in his lathes without equalizing.

The millman put in a complaint but the purchaser said that he would rather have paid the straight invoice and had the stock according to specifications. There is no need to dwell on the fact that it cost that millman more in prestige than was involved in dollars and cents in this one deal. Dimension stock is a different product from lumber, a product in which specifications must be followed carefully in detail if one would succeed in its manufacture. It is a business of details. The dimension manufacturer exists because he will take over and work out details which the user would otherwise have to work out for himself. If he fails to work them out correctly the consumer naturally fails to see why he should continue to buy stock from that particular dimension mill. The man who will make a pronounced success at dimension stock manufacture is he who glories in the working out of details and in seeing that his machines do the finest kind of work, for these are among the important items of the business though they may be overlooked in a general consideration of essential factors.—*Hardwood Record*.

Low Water in Central Ontario

A report from Lindsay, Ont., says:—The reports that the prices of lumber will drop this season, do not fit in very well with conditions such as local companies and others are facing at the present time. While the winter was an excellent one for the men in the woods, there is a scarcity of water, due to the fact of the great volume getting away this spring with a rush, leaving the smaller channels on which the lumbermen depend so much, with very little water. Then again, the fires in the north country last fall destroyed some important dams, in consequence of which reservoirs are almost entirely dry. The outlook at the present time is doubtful, and the chief hope is that copious falls of rain will relieve the situation.

Hon. W. R. Ross, Minister of Lands for British Columbia, has given his approval to a recommendation of the Chief Forester, Mr. H. R. MacMillan, for the expenditure of approximately \$30,000 to improve the forest fire fighting facilities of the Department. The money will be spent upon roads, trails and telephone lines in several of the important districts of the province.

Outline of a System which Enables the Manufacturer to Know the Cost of his Product—Factory Routine

By Jonas Howe

ous jobs going through, at the same time showing the profits on the different departments, or indicate whether they are profit-bearing factors or not. In the following articles an effort will be made to describe a cost system which will fulfil these requirements, at the same time being clear and concise in its make-up, serving in short, as a system for showing the cost of production and for reflecting any mismanagement, so that every part of the concern may be made to yield its share of the profit.

Accuracy is essential with any system for ascertaining the exact amount of time consumed in working on various orders and for learning the correct quantities of raw material which have been used, together with their proper prices and the proportion of expense which is incurred in providing them. These are the most important features to be considered in establishing a reliable system of cost accounting. Many companies have tried to follow these features in a careless or partial manner with the inevitable result of failure and confusion. If one attempted to describe the reasons leading to failure of this nature, he would have to write enough to fill an encyclopedia.

enough to fill an encyclopedia. Probably the most important feature of a successful system is its simplicity, a feature which must characterize it throughout all its details. Complication of any kind must be avoided at every turn. Beginning with the employees, a limited amount of responsibility should be placed upon each man who has anything whatever to do with the recording of the time occupied or the material consumed in the completion of a job. Each job must have its order-number which is recorded on the time sheets of the men who are working upon it, and also upon the requisitions for the raw material from which it is to be made. The natural and effective method of attending to this is to be careful that a mark or punch showing the order-number is placed upon the time sheet when the job is given out. The responsibility for making this mark or punch may be

to any manufacturing business. In the woodworking business, cost accounting, while intricate and varied, is of very great importance and can be systematized in such a manner as to give a company complete knowledge, not only of the costs of production, but of the efficiency of machinery, departments and of every individual on the staff.

A woodworking business, like many other lines of production, is a large manufacturing enterprise with several departments more or less connected or related to one another, and is necessarily at the mercy of competitors, employees and the public. At first glance, it would seem a matter of great difficulty, almost an impossibility to inaugurate a reliable system, which will show the profits on the vari-

placed upon the foreman or operator according to conditions which prevail at the plant. It is important to bear in mind the necessity for relieving the operator of all unnecessary clerical work. With this object in view, one should cut out all red-tape, such as requiring the men to write out a number of minute particulars, which in the end are worthless. The "location number" on the time sheet, indicating just where the man worked is amply sufficient for reference, if one desires to learn just what the operator is employed upon or has been doing.

No work should be allowed to proceed in the factory without a written official numbered order, (see Form I.) originals of which should be filed in the general office and first copies in the office of the factory foreman. Following this method the foreman or clerk should give the number out with each job, that is to say, he should see that the time sheets of the men who are employed upon each job bear the same numbers as the jobs. This can best be done by placing a mark or a punch on the operator's daily time sheet when an order-number is given out, the mark or punch being placed opposite the indicated time when the work is commenced, and the number of the order placed immediately below the mark or punch. Supposing the order is No. 1429 and was given out at 8 o'clock in the morning (see time sheet Form II.) When this job has been completed (10.40 a.m. as indicated by the time sheet in Form II.), the time sheet is again punched or marked and the order-number of the next job upon which the operator works is recorded below. Following out this system makes the operator responsible for having the correct order numbers and the correct time marked upon their time sheets.

The time sheets are subsequently received by a clerk who figures the hours and minutes occupied upon a job and posts the result on the "cost cards" (see Form III.). Requisition lists are used when raw material is obtained for an order. These lists are also used by the clerk in ascertaining the various quantities of lumber and other raw materials consumed. The quantities and their rates are also posted on the cost cards.

When orders are completed the cost cards are withdrawn; the labor and raw material amounts are totalled and carried forward; the summary is totalled; the overhead percentage (which will be discussed in a later article) is added and the cost is at once ascertained.

This article has dealt in brief manner with the general factory routine of cost accounting in connection with mill work. It is proposed, in subsequent articles, to discuss the various details which come up for consideration under the following headings:—

2. Raw material: Forms—Requisitions, debit and credit system.
3. Expense: Forms.
4. Distribution: Forms—Statistics.
5. General up-keep: Forms—Statistics.

Boom Timbers for Rough Weather Towing

Montreal, March 18.—Editor Canada Lumberman; Do you, or any of your correspondents know of a boom for towing logs that will prevent their escape in the event of the tug encountering rough weather? I have heard that they tow pulp wood upon the upper lakes without loss and would like very much to have a description of the boom used.—Robert B. Ross.

Capt. E. F. Burke, of Midland, Ont., one of the best informed men in Canada upon the question of towing logs, reports that the best booms, in his opinion, for towing pulpwood or logs, are made of white pine timber, not smaller than 24 inches in diameter and as big as they can be secured. They should be from 16 to 24 ft. long, bored for 1½ in. chain, coupled about 24 inches apart and blocked all across the ends to keep the chains from cutting into the soft timber. The auger holes should be bored about 18 inches back from the end of the booms, and the chains should be just long enough to permit the booms to be coupled about 24 inches apart. In towing rafts he reports that it is necessary to have two sets of such booms around each raft. This method has been found to be more serviceable than any other kind of boom timber.

Mr. Ross states in answer to the information which was sent to him as above that he used a boom similar to the one described for a number of years, with indifferent success in rough weather. He had been informed that a cage-boom built of scantling had been used with good results in other places, and asked for further information in regard to it. Capt. Burke has been kind enough to send us further information regarding booms of this nature. These were built years ago to tow across Lake Huron, but in Capt. Burke's opinion were not serviceable. One objection to them was the fact that they were towed with a single set of chains, and if a chain parted the raft was split. In round booms such as are now used in Northern Ontario, two sets are used, and if a chain parts there is still one remaining to rely upon. Two sets of patent booms could not be used because they would pound to pieces in rough weather. Another objection was that in using patent booms for towing small timber, small logs would get in between the frame work and cause trouble and expense in poking them out. Moreover, if a boom of this nature should go ashore it would

probably be ruined. The patent booms also drew twice as much water as the round booms and were very heavy to tow.

Sometimes these patent booms were known as "fence booms." They were made about 35 ft. long, and consisted of a frame work of four pieces of 10 in. x 10 in. Norway bolted to the four sides of two end pieces 24 in. square and 6 ft. long. A third piece 24 in. square and 3 ft. long was used in the centre, the frame work being bolted to it in the same manner as to the end pieces. The bolts used were 1¼ in. Such a boom would not only be very heavy, but very expensive. The separate parts of the boom were held together by chains which permitted them to float at a distance of 2 ft. from each other.

Further information upon this subject is invited from readers of the Canada Lumberman. If anyone can furnish information which would be of assistance, we will be very pleased to forward it.

Hope to Capture the Eastern Trade

B. C. Lumbermen Planning Active Campaign for Taking Advantage of Low Freight Rates via Panama Canal

British Columbia lumbermen hoping to invade the New York market and that of Buenos Aires are looking forward to the pageant parade to be held at Vancouver, on June 12 as a means of bringing their lumber and timber to the attention of the Atlantic Coast and South American buyers. Mr. Harry G. Hayes, who has been appointed by the lumbermen to take charge of their parade at the time of the pageant, pointed out recently that following the opening of the Panama Canal there was no reason why British Columbia should not capture a large share of the lumber trade of the East Coast. At the present time, Washington mills competing against the southern yellow pine interests, manage to dispose of a large quantity of Douglas fir every year on the Atlantic coast, selling both in New York and Buenos Aires by cargo as well as shipping overland by car to points in the Eastern States. Although at the present time the British Columbia mills do practically no cargo shipping at all to the East Coast and sell comparatively few carloads to the Eastern American towns, Mr. Hayes believes that as soon as the canal is opened for commercial business the mill owners of this province will be placed in a splendid strategical position from a trade point of view.

British bottoms are cheaper on charter than American boats, he points out, and Seattle and Tacoma can not, under American maritime regulations, use British bottoms for cargo shipments to New York. This will mean that Vancouver can ship cargoes to New York cheaper than Washington cities will be able to do through the canal. This relative cost advantage applies even at the present time, around the Horn. He claims, further, that although the cost of lumber production is somewhat higher in British Columbia than in Washington, the difference is not by any means so great as has been supposed and in fact some of the British Columbia mills are producing just as cheaply as any of those across the line. The Panama Canal will have the effect, he believes, of cutting the cost of transportation to the Atlantic Coast by about sixty per cent., thus helping out all the Douglas fir shippers in their fight for the market against the yellow pine shippers of the Southern States. The net result will be, he points out, that both British Columbia and Washington shippers will be aided by cheaper transportation, and through their ability to use British bottoms the lumbermen of this province will have an extra advantage over their fellow shippers of Douglas fir in Washington State.

The opportunity for British Columbia lumbermen to seize the Atlantic coast markets, both in North and South America is here," he said. "Realizing the advantages which they can obtain in a publicity way, many mill men of the city propose to bring the lumber resources of the province to the attention of the buying public just as prominently as possible. It is planned to make the lumber parade for the pageant the most pretentious affair that ever took place in the city. It will probably be from three to four miles long. Moving picture companies are now preparing to take views of the parade, and by means of these, through newspaper reports of the affair, and also through the reports which the Ad Men will send home from their convention at the same time, our lumbermen look forward to a great deal of beneficial publicity in the east, which will no doubt lead to the building up of a large future cargo business on the east coast.

"Much of the success achieved by the Washington mills came by reason of the advertising they obtained through the monster parades held in Tacoma and Seattle a few years ago. The Seattle parade at the time of the A. Y. P. fair there was seven miles long. Moving pictures of it were shown all over the United States." Efforts are being made to have every mill in or near Vancouver well represented in the lumbermen's pageant parade. There will be many special floats typical of the various phases of the industry.

Mistletoe thrives on the western coast to an extent not approached in the east. In many places this parasitic growth is responsible, directly or indirectly, for a considerable loss of timber.

Twenty-five Thousand Pieces Ready for the Drive—Muskoka Wood Manufacturing Company, Ltd., Huntsville, Ont.

Interesting Northern Ontario Log Dumps

Reports from many of the lumber manufacturing companies of Northern Ontario indicate that the past winter was an excellent one for taking out logs in the woods. Whether all these logs will come down to the mills during the drives is another matter. The accompanying illustrations indicate the truth of the reports about the quantity of logs taken out. They represent a couple of log dumps belonging to the Muskoka Wood Manufacturing Company, Limited, Huntsville, Ont.

One of the illustrations is of a river scene on Marys River. The log dump contains 25,000 pieces. These logs are piled fully 100 feet high and an idea of the height may be obtained by the comparative height of the men who are working on top of the dump. They are so small that it is with difficulty that they can be made out. They appear merely as small black specks against the background of trees, just to the right of the group of white birch trees near the centre of the picture. The operations in connection with this dump were in charge of foreman James Lamb.

The other illustration shows a dump on Black Creek, where 28,000 pieces were dumped on the shores and in the Creek under the direction of foreman William Edgerton. Only a section of this dump is shown in the illustration. In all, it extends over a distance of a mile and a quarter.

A third log dump, of which we are unfortunately not able to show a good illustration, was in charge of foreman William Bonser. It was located on Axe Lake and contained 35,000 pieces. This dump was in circular form.

The logs in these three dumps are largely hemlock, spruce and pine. The company's hardwood is dumped on the lake shores adjacent to Huntsville.

During the sawing season of 1914, the Muskoka Wood Manufacturing Company expect to cut about four million feet of hemlock, two million feet of birch and other hardwoods and one million feet of spruce and pine. Most of the hardwood will be manufactured into "Red Deer Brand" hardwood flooring at the company's mill at Huntsville.

The Forest Products Exposition

The Forest Products Exposition which opened at Chicago on April 30th is a most important event for the lumbering industry in

America. The manager, Mr. Geo. S. Wood, in a recent official announcement, stated that during the last few weeks, previous to the opening, the interest taken by the lumber industry, and by the public in general, had greatly increased, and that co-operation had been promised by many bodies of wholesale lumber dealers and manufacturers in cities which had not hitherto been represented. Among these he mentioned many United States cities and Toronto and Ottawa. The indications then were, that the pressure for space by exhibitors would be very great during the last few days before the opening. Many important trade conventions are to be held during the exposition both at Chicago, and at New York, where the exposition will open on May 21st.

Opening New District on South Fork of Fraser

Eighty thousand acres of land, adjacent to the G. T. P. Railway in British Columbia, will be opened to pre-emption in the valley of the south fork of the Fraser River in June, according to an announcement made by Hon. William R. Ross, minister of lands. The main industry of a great part of the valley, other than farming, will be lumbering, and this should reach considerable proportions. There is a large amount of good timber, and the lumber mills built to handle it, together with the towns along the railroad between Fort George and Mount Robson Park should prove a ready market for farm produce from the district. A large mill with maximum daily capacity of 100,000 feet has been built by the Upper Fraser River Mills Company at mile 142, near Dome Creek. A pamphlet descriptive of the district, with special maps showing the various lots which will be available for pre-emption in the valley in June, is now being prepared and will shortly be issued by the department of lands.

Serious charges were recently made in the New Brunswick Legislature by L. A. Dugal, a member of the Legislature, against Hon. J. K. Fleming, the Premier of the province, who was also Minister of Lands and Mines. The charges were to the effect that the Premier had been a party to the extortion of about \$100,000 from the lessees of provincial timber lands, of which amount no account had been given nor any return made to the revenue of the province. The details of the charge are to the effect that, in addition to the increased bonus provided for by an act of the Legislature passed dur-

Twenty-eight Thousand Pieces Ready for the Drive—Muskoka Wood Manufacturing Company, Ltd., Huntsville, Ont.

ing the last session, every operator had been obliged to pay \$15 a square mile, through the agency of W. H. Berry, superintendent of scalers, and under the direction of the Premier himself. Shortly after the presentation of the charges in the House, the Premier resigned and arrangements were made for an immediate investigation.

Quebec Forbids Rough Lumber Exports from Railway Lands

The Quebec Government, through the Department of Crown Lands, has (says a despatch from Quebec) taken steps to prevent the wholesale exportation of lumber to foreign countries by corporations who have been granted timberlands as subsidies by the Government. Article 13 of the Woods and Forests Regulations, passed by Order-in-Council in April, 1910, will apply for all Crown lands given as subsidies to railway companies. "The timber in such lands must be manufactured in Canada: that is to say, converted into pulp or paper, deals or boards, or into any article of trade or merchandise of which the said timber is only the raw material." The timber, properly squared or made into ties, will be considered as manufactured, but roughly trimmed lumber will not.

Pushing Canadian Shingles

A report from Kansas City, Mo., published by a United States lumber trade journal, says: The Chicago Lumber and Coal Company is pushing Canadian red cedar shingles. The company began working with the Canadian product about two weeks ago and their success has been so great that they can't talk about anything except Canadian shingles. The Canadian shingles come from British Columbia. They are upright shingles and grade 100 per cent. clear, the company say. They are 4 inches and wider, and guaranteed full thickness. The Canadian shingles are quoted twenty cents higher than the ordinary shingles, but they are going in good shape at the higher figure.

Overhead Carrier for Lumber Shed

An overhead carrier system in connection with a retail lumber shed may be used to much advantage as shown by a description of one installed by a correspondent of the American Lumberman. Their shed, he says, is built with the driveways at right angles to the railway tracks which are adjacent to the back end of the shed. The shed is of the double-deck type, with the roof sufficiently high to enable us to support the carrier track from the roof, which we have timbered up to carry the load. The runways on each side of the driveways at second deck are also built sufficiently strong to carry the load after the carrier has been released. At the end of the shed next to the track we have a large door opening on a level with the car doors, and just inside the shed on the same level we have a platform upon which we rest the carrier while being loaded, the lumber passing directly from the car to the carrier.

We used an enclosed track, with 16-wheel trolley carrier. To this we attached a triplex chain block of two-ton capacity, with sufficient length of lift to cover the distance from the first to the second deck. Attached to this block we have a car built of 4 x 6 timbers for sills and top carrier beam, with 4 x 4 frame work. To maintain the rigidity of the framework of the car a road is run over each arch with a nut on each end underneath the sills. At the outer end of the car we use a bale, similar in operation to a bucket bale. This bale may be released at top of carrier beam and will fall down so that the car may be removed from load, after which the bale may be replaced and fastened with the automatic fastener on end of carrier beam.

It is extremely important that the principle employed in the construction of this car be adhered to, else the load will not balance, and trouble will be experienced. The framework at the end of the car is simply to hold the car rigid when the end bale or support is released. The two point suspension is to overcome the tendency to tip when the load is out of balance. The weight of a man standing on the end of the load does not affect the balance perceptibly. If one point suspension were used this unequal weight would result in the spilling of the load.

In operation the load is carried down the track endwise to a point opposite the bin in which you desire to place it, the load is then turned around with the end toward the bin, and the load left to rest on a pair of wooden trestles if on the lower deck, or upon the runways if on the upper deck, where it may be placed in the bin with the least possible expenditure of energy and time, while the carrier car goes back to the car to be reloaded.

The convenience and efficiency of this device are its strong points. By its use it enables three men to do the work of four men and two teams in the old way, and has the added advantage of filling the upper deck as conveniently and as cheaply as the lower deck. This feature alone is an item to be appreciated in the construction of a lumber shed.

Getting Prompt Payment

It is a principle of law and a conclusion which your books will prove, that sales are not completed until payment is received.

When you invest your capital by extending credit and it is not returned at the time agreed, your cost is increased and your profit reduced.

In these days of strenuous competition, it is up to the dealer to secure prompt return of his capital, re-invest it in new goods, and thus keep up the volume of sales.

Have definite terms. First, be sure that your customer understands them. Second, enforce them. If they were agreed to at time of purchase, they were plainly satisfactory then and you have every reason to insist that they be respected. Unless the customer convinces you that he is fully warranted in asking additional time, insist that he live up to his promise to pay on the due date.

A dealer can readily train his patrons into one of two habits—the habit of prompt pay or the habit of delinquency.

It may be impossible to bring about immediately a strict compliance with terms. You can't make a sudden jump, but you can follow a policy of swinging your old customers into line and of seeing to it that your new patrons have the right attitude from the start.—Goodyear No-Rim-Cut News.

Fundamentals of Success

There are a number of fundamental features necessary for the successful operation of a retail lumber yard.

One of the essentials is a demand for lumber in the locality where the yard is located.

Another is the selection of a stock suitable to the needs of the community.

An important consideration is a well-kept yard, uppers protected from the weather, good foundations, planked gangways and the yard throughout kept free from refuse.

Also a system of accounting whereby a balance sheet showing the true condition of the business may be drawn off at any time.

The items enumerated are those that will naturally occur to the average dealer, are necessarily routine matters, and when once established may be continued for an indefinite period.

Salesmanship or securing business on other than general lines is a question that would require a study of local conditions to outline correctly, however, any plan adopted would demand aggressiveness as the principle characteristic.

There are many men who possess the knowledge, ability and energy to organize, manage and direct the purchasing, maintenance of stock and an accounting system in connection with a lumber yard.

Likewise they can sell lumber at some kind of price, but it often happens that the price is more beneficial to the buyer than to the seller.

As the profit received from the investment of one's capital and effort is the incentive for maintaining or following any mercantile pursuit, it is quite within the limits of reason to assume that the fundamental feature of the greatest importance in the lumber business, is a selling price that will be productive of a fair margin of profit.

The dealer who knows to a certainty what it costs him to do business is in a position to state positively the prices at which he can sell; prices that will be fair to the purchaser and still leave him a legitimate return from the transaction.

Should he happen to be the only dealer in his locality, he will have only his own affairs to consider and equitable dealing on the lines specified will quite likely keep his customers satisfied.

Should there be two or more dealers in the same locality and one or more of them is not properly posted regarding the detail and costs of operation, there may be a variation in selling prices.

The dealer who is not posted regarding costs, may, from inability rather than wrong intent, make rates so low that they will be unproductive of profit.

In such a case it is quite within the province of business acumen or plain "horse sense" for the dealer who knows to point out to him the error of his ways and aid him in taking a post-graduate course in establishing selling prices that will enable him thereafter to play the game in accordance with the opinion held by all fair-minded men, which is, "the laborer is worthy of his hire," or the old adage about not muzzling the ox that treads out the grain.

Instructing a brother lumber dealer in a method whereby he may know the right price to charge for his wares is not a menace to the public interests.

On the contrary it is a benefit, as it enables him to do business on right and equitable lines, thereby insuring a profit on his transactions, likewise induces him to join the constantly increasing throng of merchants who are willing and anxious to accord the same privilege to others. G. A. B. in The Pioneer Western Lumberman.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tt

Wanted For Factory Use

One-inch Black Ash and Basswood. State your lowest price and grades, together with full particulars. Box 13, Canada Lumberman, Toronto. 9

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS,
Hamilton, Ont.

7-12

Wanted to Buy

One million feet 1-in. Dead Cull Pine, also fifty thousand feet 1-in. Cull Spruce or Hemlock. Apply

M. BRENNEN & SONS,
Hamilton, Ont.

6-9

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
Montreal, Que.

Saw Mill Machinery For Sale

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber T. ble, 5-Saw Slab Slicer, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.
The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

Captain Dollar Discusses Tolls

Captain Robert Dollar, of San Francisco, owner of the Dollar line of steamships, recently discussed the Panama Canal and the toll question as follows: "There is no doubt but that the canal will be of great benefit to the Pacific Coast but it depends upon how the toll question is settled whether the lumber industry will be greatly benefited or not. It is plain that if the free tolls act is repealed the lumber industry of the Pacific Coast States will be hard hit, as British Columbia manufacturers will be enabled to ship lumber on foreign bottoms through the canal at such low rates that American millmen cannot compete in intercoastal trade. Even if American ships are exempted, foreign bottoms still have an advantage as foreign ships are operated at lower cost. Charging American ships tolls simply means an additional barrier to domestic shipping. It seems that the lumber business gets hit at every turn and now comes the toll bugaboo and adds another thrust to the industry."

Captain Dollar said that there were no American lumber ships on the Pacific Coast large enough to make it profitable to carry lumber at long distances. He says that a ship, plying from the Pacific Coast through the canal to the North Atlantic Coast, must have a capacity of at least 5,000,000 feet in order to make a fair profit. His company is having built at Clyde, Scotland, a carrier with a capacity of between 5,000,000 and 6,000,000 feet to engage in long-distance shipping. Captain Dollar has contracted to transport 24,000,000 feet of lumber from Victoria, B.C., to New London, Conn., whence the lumber will be trans-shipped to Toronto, to be used in the construction of the government wharf works.

Export Duty on Logs

The United States Department of State has agreed to open negotiations with Canada for a trade agreement by which the shingle manufacturers of Washington will be relieved of the burden of paying the export on

shingle logs that Canada now imposes, says "The Timberman." Senator Poindexter took up the question of a removal of the duty on exportable cedar logs with Secretary of State Bryan, presenting facts concerning the differences in the value of cedar logs to the Canadian and American manufacturer. As the United States imposes no export duty on logs or an import duty on shingles entering the United States, it is only fair, he claims, that Canada should reciprocate, thus placing the manufacturers of both countries on an equal basis. Secretary Bryan has sent to Senator Poindexter the following notification, stating what the department will undertake to do in the settlement of this controversy:

"In view of the disadvantages to which the American manufacturers of shingles along the Canadian border are subjected by reason of the restrictions placed by the Canadian provinces on the export of logs, and pursuant to your request, appropriate instructions will be transmitted to our consul-general at Vancouver B.C., to investigate the facts and, if the circumstances warrant, to take up the matter with the proper Canadian officials—with a view to secure, if possible, a removal of the restrictions, to the end that the American exporters may receive fair treatment.

"You are further advised that in any negotiations that may take place under the tariff law of October, 1913, for the conclusion of trade agreements, the subject to which your letter relates will receive due consideration."

Exposition Flag Poles

About half of the large flag poles which have been used on the exposition grounds of the Panama-Pacific Exposition are made in a specially constructed machine that is capable of turning out spars and poles up to 34 inches in diameter and 150 feet in length. About 100 85-foot flag poles have been manufactured, and over 300 electric light standards running as large as 22 inches in diameter and 60 feet long have been turned out through the use of special machinery.

Douglas Fir

The production of Douglas fir lumber has increased thirty-eight per cent. in the last two years, according to a recent publication of the Dominion Forestry Branch on the forest products of Canada. This percentage is double that of any other leading Canadian wood for the same period. This tree made up 67.7 per cent. of the total lumber production of British Columbia, which province is estimated to contain as much timber as all the rest of Canada. The importance of the Douglas fir is exemplified by a statement made

by Dr. C. S. Sargent, the leading authority on American trees, who says: "No other American tree of the first magnitude is so widely distributed, or can now afford so much timber, and the rapidity of its growth and its power of reproduction under favorable conditions make it the most valuable inhabitant of the great coniferous forest of the northwest."

Fixing Line Shafting

To fix line shafting in a direct line with an existing shaft, commence by fixing securely a wooden bracket on the wall, standard or column. Be careful to see that the top of the bracket is level, and also exactly level with the centre of the shafting. When this bracket is fixed correctly, then, with a truly parallel straight-edge, level on to where it is decided to fix the first permanent bracket; then fix another wooden bracket close to but not interfering with position of bracket, and so on, as far as may be necessary. These temporary brackets will enable you to set off the proper positions of the permanent brackets accurately, and also form an excellent guide in fixing them correctly in position. If, as is frequently the case, the line of shafting is to be hung from the beams carrying an upper floor, the method of procedure will be exactly the same as that already described, only that the temporary arrangement will take the form of a hanger instead of a bracket.

To get the parallel line, stretch a line parallel to the existing shaft for about 20 or 30 feet of its length and as near as possible to it. No doubt there will be pulleys, straps, and other obstacles in the way, but there will be no difficulty in clearing them. Continue the line the required distance, and when set truly parallel, fix it securely; then set off from it on each wooden bracket the correct centre line of shafting. When this is correctly accomplished the fixing of the permanent brackets may be proceeded with.

In order to insure accuracy and also to facilitate the final adjustment of the shafting the bracket should be kept about half an inch low. This deficit is made up by a piece of hard wood of the proper size being fitted on the bracket for the plumber block to rest on.

In laying down or erecting plant in a new concern the first thing to be done is to get in or set off a line on the floor parallel with the line of shafting, or, if this is not erected, exactly true with the projected line. This line should be traced in in some way, so that it may not be lost, as it will require to be frequently referred to. From the scale drawing of shop, set off the positions

of the foundations of each machine, which, as a matter of course, must be accurately true in every respect with centre line. It is frequently necessary to set off a square line from the centre line. This is very often got in by using a large square, but we much prefer the ordinary method of raising a perpendicular from the straight line.

In transferring a line from the floor to project a line of shafting, a centre "plumb-bob" must be made use of in conjunction with temporary wooden brackets, as above mentioned. By the methods described, countershaft, auxiliary, or any description of parallel shafting may be set off readily, but in every case we strongly advise the fixing of temporary means for readily tracing or marking the necessary lines.

To arrange the different things true with each other, the greatest care must be exercised to see that machines are set exactly level and absolutely true with the shaftings, as if not so fixed no end of trouble will arise through the belt working badly on the pulleys. For belt-gearing the shafts carrying the pulleys should be absolutely level and parallel with each other. If they are so, no difficulty can be experienced with good belting. In finally levelling the bearings for a line of shafting many erectors lay the straight-edge in the bottom of the bearing. This, for obvious reasons, is not a good plan, and the method we adopt in our own practice is to prepare a piece, or, rather, two pieces, of hard wood the diameter of the shaft, cut them to exactly the centre line, and lay them in the bearings when applying the straight-edge in levelling. — Timber Trades Journal.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario continues on the same quiet basis as has prevailed for some weeks. The situation is one which is puzzling wholesalers considerably. In addition to the decrease in the demand for stocks, as compared with the corresponding period in previous years, the factor of competition is becoming much more severe. Continual changes are reported in the class of stocks which are being used by retailers, and large manufacturers who use lumber as a raw material. So great are these changes that one important wholesaler remarked to the Canada Lumberman that he was more perplexed by the condition of the market to-day than he had ever been before. Wisconsin hemlock, Tennessee hemlock and Michigan hemlock, for instance, he said, were competing successfully with hemlock from Northern Ontario, and the Ontario manufacturers, moreover, could not sell their stocks any cheaper and make any money. The whole situation, he said, was exceptionally puzzling, and he could not venture an opinion as to the direction of trade developments in the near future.

Prospects for trade throughout Ontario at present, he reported, were not good. Trade in fact is very quiet throughout the country. In the large cities and important consuming centres a fair amount of trade is in progress, although it is far short of the usual volume at the present time of year. Backward weather has had a share in bringing about these conditions, but general trade conditions seem to be the most important factor. One of the most serious results of the situation is the increasing tendency toward price-cutting, which is making it very difficult to secure trade at a profit and is causing much more harm than good. A sluggish market such as the present one, cannot be improved by price-cutting. The only result is that many firms, which are already experiencing the difficulties arising out of reduced volume of trade, are suffering to a still greater extent because of the price-cutting which reduces their margins and restricts their trade.

In spite of the fact that money became cheaper shortly after the opening of the year, collections are still a matter of great concern to the trade. Wholesalers report that they find it more difficult than usual to get their money. On the whole, the trade seems still to be uncertain about the developments of the immediate future, and to be marking time and seeking to adjust its business and financial relations in such a way as to be ready, either for better trade when it may develop, or for a continuation of quiet times, if improvement does not come soon.

Eastern Canada

Better trade is reported at Montreal. Wholesalers say that orders are being placed more freely and there is more pronounced activity throughout the trade. Shortleaf yellow pine, and the better grades of southern pine are affecting the market to some extent. Practically all prices are unchanged and firm. There is a better demand for hardwoods. Prices of lath are firm and stocks are scarce. New Brunswick shingles show a tendency towards slightly easier prices. The desire of the railway companies to increase export freight rates from Ottawa points to Montreal is causing the trade some anxiety as the market in Great Britain is slow. Ocean freight rates however, are low, being 37s. 6d. per standard, a reduction of 5s. as compared with last year.

A better demand is reported for spruce at New York and in the adjoining territory. Very little new building has been started, and the yards are going along quietly with their present supplies which seem to be ample. Indications of stronger prices are noticeable and it is thought that the worst of the situation has passed, so far as price cutting is concerned. Some improvement is also noted in spruce at Boston. Quotations of less than \$25 basis are becoming rare. It is thought that there will soon be extensive building activity which has been held back by bad weather. Better demand is reported for random. For 2 x 4 \$23 has been asked recently, although it is still possible to buy at \$22.50 and sometimes \$22. For 2 x 3, \$21.50 is being quoted, but there are still sales at \$21. For 2 x 6 and 2 x 7 the price ranges from \$20.50 to \$21, with 2 x 8 at \$22.50 and \$23. Enquiry is light for 2 x 10 and 2 x 12 and quotations are \$24 to \$24.50 and \$24.50 to \$25 respectively. The demand for hemlock boards at Boston is light and buyers are refusing to pay more than \$24. Many of the sales are going through at \$23.50.

An increasing demand is reported for lath at Boston and prices are stiffening. For 1½", which was recently selling at \$4.10, the rock bottom price is now \$4.15 and some sales are being made at \$4.20. It is even said that some merchants are asking \$4.25 and getting it.

For 1-in. lath, \$3.90 is asked, but business is still going through at \$3.75 and \$3.80. White cedar extras can be had at \$3.50 and standard brands are selling at \$3.55, with the commission off. Second clears are ranging from \$2.75 to \$2.90. Vancouver and Washington shingles are selling at Boston at \$3.75 for the best brands, while very good extras are to be had for \$3.65 and \$3.68.

Great Britain

The Board of Trade report for the month of March is very satisfactory. Both exports and imports show increased values. The chief increase in imports was in raw cotton. The total value of imports was £66,935,228, an increase of £5,592,784, over March, 1913, or 9.1 per cent. The total value of exports was £44,518,661, an increase of £2,828,714, or 6.7 per cent. For the three months ending March, the imports showed an increase of 0.3 per cent. and the exports an increase of 4.9 per cent. as compared with the first three months of 1913. Imports of hewn timber from Canada during March, 1914, totalled 1,193 loads as compared with 2,719 loads in March, 1913. The values were as follows:—March, 1914, £6,858; March, 1913, £12,004.

In spite of the satisfactory Board of Trade report, it is difficult to find anyone who is satisfied with the London spot market for wood goods. Deliveries have continued on a fairly extensive scale, but have not been sufficient to diminish the surplus stocks of deal sizes. Importers, therefore, are not showing any interest in forward buying. Export business shows a little more signs of life. Values have remained fairly steady, particularly for good stocks. It is difficult, however, to secure good prices for stock which is of doubtful grade. New Goods are expected to arrive on a somewhat lower basis of prices, on account of the reduction in freights. Deliveries at London docks for the week ending April 4th totalled 3,983 loads, as compared with 3,742 in the corresponding week of last year. At Churchill & Sims' recent auction sale, 2½-in. Quebec birch planks brought 1s 7d, and 2-in. 1s 5½d and 1s 5d.

A fair amount of business has been completed at Liverpool for cargoes for forward delivery on c.i.f. terms, and values have been well maintained. Offerings of the better class of deals do not appear to be very large. Liner parcels were still arriving, at latest reports, and apparently "no reasonable offer" was being refused. This season's liner shipments have been of a better quality than usual, yet importers have been able to secure them at much lower prices than those which have prevailed for cargoes of inferior deals and poorer specifications. The spot market at Manchester is fairly steady, the arrivals of parcels not being so extensive. It is expected that, when cargoes which have already been contracted for, commence to arrive, there will be no necessity for taking such low prices as those existing today.

Up to the end of March, imports into Manchester and Liverpool were more than half as much again as those of the corresponding period last year and were only 500 standards less than the combined consumption. Without any further arrivals there was, at latest reports, more than three months' consumption still in stock, and only one month to go before the season proper would commence. The building trade appears to be on the eve of a revival, but the improvement must become much more definite before the effect is felt in the lumber trade.

A little more improvement is reported in the Liverpool market for birch. Arrivals have been more frequent. At present, the consumption is a little greater than the arrivals can keep up with and stocks are being gradually reduced, although not to any great extent. Values remain steady, especially for logs. Heavier arrivals are expected during the next month or two.

At Glasgow, conditions remain unchanged, the volume of business continuing fair. A little more request is reported for spruce, and there has been a steady movement from stocks. The demand is best for wider sizes, but there has been an increased enquiry also for Quebec yellow pine deals and sidings are moving steadily, but not rapidly. Stocks on hand are somewhat depleted, except for sidings.

United States

Business conditions throughout the United States continue on a very perplexing basis. Inactivity seems to have spread, rather than otherwise, in spite of the fact that there is an abundant supply of cheap money and that the government crop reports have been most encouraging. A great deal of attention is being paid to the decision which will be given by the Interstate Commerce Commission upon

Headquarters for Norway Silo Stock.

the application of the railroads for a five per cent. advance in freight rates. It is believed that, if this application is granted, the railroads will gradually get back into the market. They will be certain, at least, to place orders more liberally than at present. The steel trade, although still operating on the same basis as a month ago, is receiving very few new orders.

During the last fortnight an increased demand has developed for lumber from the smaller towns. A month ago the demand was from the larger cities. This is a seasonable development, due principally to the retail trade and the factory and building requirements. Big consumers have not been making any unusual call. The dullness, so noticeable in all other branches of business, is also evident in the

lumber trade. There has been no contracting for large amounts.

The Southern pine situation is reported to be fairly encouraging. Conditions on the Pacific Coast are practically unchanged. A little better trade is reported in Northern pine, although the demand has been held up by bad roads. Shipments are about normal and there is good prospect for increased business, as crop conditions are ideal. Prices are firm and manufacturers are expected to have a shortage of possibly 30 per cent. compared with the normal output. The demand at the foot of the lakes is seasonable. The spring demand for hemlock has not yet started actively, but dry stocks are low and the outlook is regarded as promising. Eastern spruce manufacturers report that orders are more numerous. Prices are unchanged.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Continued Improvement at Montreal

Montreal, April 27th (Special to the Canada Lumberman): The improvement in trade, noted in our last issue, has continued, despite the late opening of the season consequent on the bad weather. Wholesalers state that orders are being placed with much more freedom, and there is a decidedly optimistic feeling as to business in the immediate future. Some firms, however, view with dissatisfaction the continued dumping of short-leaf southern pine in Canada, at prices which have a tendency to depress quotations for pine lumber. It is also stated that, lately, some of the better grades of southern pine have been coming more freely into the Montreal market. Quotations for practically all descriptions of lumber keep firm.

Hardwoods generally are in better request. Lath is very scarce and stiff in price, but New Brunswick shingles, extras and clears, are inclined to ease off.

Exporters are complaining of the attempt of the railway companies to increase freight rates from Ottawa points. Orders in Great Britain have been booked on the basis of the present schedule, and in the event of the new rates being confirmed by the Railway Commission, losses of from \$3.40 to \$5 per car will have to be borne. Those might have been avoided had the companies given notice at the end of last season instead of at the commencement of the present one. The present outlook is adverse to any heavy export business, the demand for Canadian lumber in Great Britain being slow. One good feature is a reduction in ocean freights, the steamship companies charging 37s. 6d. per standard against 42s. 6d. last year, when rates were raised to the extent of 5s. now taken off. The reason for the reduction is the anticipated scarcity of cargoes.

Ground wood is a quiet market, owing to the excellent water conditions in the United States. This will probably continue for another four or five weeks, after which it is expected there will be some heavy orders placed with the Canadian mills. Prospects are that the consumption of ground wood pulp will increase considerably this year.

Chemical pulp is a strong market. The manufacturers of kraft are shipping very heavily.

The trouble in Mexico will make for larger orders for newsprint from the United States. The previous war, in which the United States were engaged, increased the use of paper by 30 per cent.

Ottawa Operations Retarded by Ice

Ottawa, April 21. (Special to the Canada Lumberman).—It was expected that the sawmills along the rivers in this district would have begun operations by this time, but the ice is still fairly thick in many places and until it breaks up, operations will have to be held up. In some parts of the Ottawa Valley, especially at Lake Deschenes, an expansion of the river, the ice is still strong enough in some places to support a team of horses.

Trade generally is not very brisk. There is a noticeable absence of any movement in speculative building even though Ottawa, like Montreal and Toronto, is badly in need of small houses. The country has not yet recovered from the financial stress that has been so marked lately; and no very radical change is looked for until the result of this year's crop is known. No changes in prices worthy of mention have taken place recently.

There has been considerably more timber cut in the woods during the past winter than for several previous seasons, and most of it has already been sold. Prices have remained steady and no advances are expected for some time; at least not while the market continues in its present condition.

Whether wood blocks are better for street paving than asphalt is again causing considerable discussion amongst civic officials in

Ottawa as several contracts for spring paving are about to be let. There is a marked disposition in some quarters to try out the wood blocks more extensively, since they have proved satisfactory on the Plaza and the new Bank street bridge.

Senator W. C. Edwards, head of the lumber firm that bears his name, made application today to the Private Bills Committee, of the House of Commons, to secure the legal right to dispose of surplus hydro-electric power which he is developing at his plant at the little Chaudiere Falls. The Commission had been consulted.

It is understood that W. C. Edwards Company have for some time been generating electric power for their own plant and now finding they have a little surplus, desire to dispose of it at reasonable rates. As for competing with the Hydro-electric, Senator Edwards says the idea is absurd. He explains that he is president of the Ottawa and Hull Power Company, from which concern the Hydro-electric Commission buys most of the power it supplies to the people of Ottawa through the Ottawa Municipal Electric Commission, which operates under the jurisdiction of the Hydro.

A good deal of talk is being indulged in both in Great Britain and Canada to the effect that Hon. George Perley will be appointed successor to the late Lord Strathcona, as High Commissioner for Canada. It is said that his appointment to this high office is practically assured. Incidentally Mr. Perley is a native of the United States, having been born at Lebanon, N.H., and one of the best known lumbermen in Canada. He took over his father's extensive interests on the death of the latter and became a partner in the firm of Perley and Pattee. Mr. Perley is now identified with the Riordon Pulp and Paper Company, of Hawkesbury, Ont.

St. John River Clear of Ice

A despatch from St. John, N.B., under date of April 21st, says:—

The St. John River is clear of solid ice this afternoon the entire distance from Grand Falls down to Bear Island, about 22 miles above Fredericton. The ice has been running as far down as the head of Mactaquac Island, 14 miles above this city. A tremendous jam has formed there and extended at noon today as far up river as Bear Island. The big jam is already eight miles long and the tremendous pressure of ice running the entire length of the river as far as Grand Falls with a heavy current behind it is expected to cause the ice on the lower river to make a move at an earlier date than expected. Those who keep close tab on the water and ice at this season of the year were surprised this morning when word reached here that the ice had been running throughout the night from Grand Falls down to such a short distance above Fredericton. The St. John River Log Driving Company's officials were taken completely unawares.

Arthur V. Rowan, manager of the corporation drive, reported that the preparations for handling the early run of logs were about completed and the company were ready to hang their booms just as soon as the ice moved out.

Liverpool Requiring Only Moderate Shipments

The United States Daily Consular & Trade Report in a recent issue contained the following reference to the timber trade at Liverpool, England, and other Mersey ports during 1913:—"The tonnage employed in the timber trade of Liverpool and other Mersey ports during 1913 is estimated at 896,000 tons, as against 821,000 tons in 1912 and 737,000 tons in 1911. (These figures include the tonnage which entered the Manchester Ship Canal from the River Mersey.) The business of the past year in the aggregate, as indicated by the above figures, exceeded all previous seasons. The year opened under fairly favorable conditions, comparatively light stocks, a firm market,

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

but as the season advanced business became more difficult, labor troubles, it is claimed, causing delay in deliveries and transportation, which tended to check consumption, and dearer money restricted operations.

"On the whole the deliveries were only fair. With the exception of spruce deals and pitch pine, values were fairly maintained throughout the year, and stocks, though ample, at the close of the year were not excessive. For the current season shippers are urged to act with care in shipping moderately. During the spring and summer, freights ruled firm and at high rates, but declined sharply during the late autumn.

"The arrivals of American pitch pine during 1913 were very large, about 8 per cent in excess of the total for 1912. The season, commenced with light stocks and a fairly steady market, but prices for all kinds declined as the season advanced, chiefly owing to drooping freight rates, and sales became most difficult at reasonable prices. The stocks at the close of the year were quite ample for the requirements."

Canadian Stocks at Liverpool and Manchester

H. W. Lightburne & Company, Liverpool, England, and John E. Moore & Company, St. John, N.B., report upon stocks of Canadian spruce, pine and birch at Liverpool and Manchester on April 1st as follows:—

Spruce and Birch

Month Ending 31st March, 1914

Liverpool and Manchester Markets Weaker

Duncan, Ewing & Company's monthly timber circular dated Liverpool, April 1, has the following to say respecting New Brunswick an Nova Scotia spruce deals: The import to Liverpool for the month was 3,850 standards, leaving a stock on hand of 6,090 standards here. To Manchester 1,530 standards were imported and 2,400 standards were delivered, reducing the stock to 11,560 standards. The market is weaker in Manchester and Liverpool, and liner parcels were sold during March at £8 10s to £8 15s, c.i.f. Liverpool, for an ordinary Halifax specification. Wholesale prices current are quoted as follows: Birch, St. John, 1s 6d to 2s; birch planks, 1s 2d to 1s 4d; spruce deals, St. John, Miramichi, etc., £9 10s to £9 15s.

London Timber Market Report

Churchill & Sim, London, England, in their wood circular under date of April 3rd, report that stocks in the public docks at the beginning of the month amounted to 13,877,000 pieces as compared with 12,350,000 pieces at the corresponding date in 1913.

Deliveries for the first quarter of 1914 amounted to 6,518,000 pieces as compared with 6,274,000 pieces during the corresponding quarter of 1913.

Importations from New Brunswick were as follows:—

Pine deals, 3,000 pieces, against nil pieces in 1913.

Spruce deals, 54,000 pieces, against 105,000 pieces in 1913.

Birch planks, 100,000 pieces, against 64,000 pieces in 1913.

There were no importations from the St. Lawrence.

The month's importation was practically limited to some parcels of birch planks which are wanted, and prices are again inclined to harden. The market for pine deals shows no change, and the stock is ample in view of the demand. Spruce deals were sold somewhat

freely during the month, but recent prices were strongly maintained with here and there a slight improvement in values.

From the pitch pine ports the figures are:—

Deals, etc., 132,000 pieces, against 72,000 pieces in 1913.

Timber, 9,400 pieces, against 23,800 pieces in 1913.

The stock of sawn timber has been reduced during the month, but is still large. Prices fell away under a little pressure to realize, and under the influence of a demand checked to a large extent by labor troubles. The market for deals is weaker, and the stock has accumulated somewhat. Values to arrive are fully maintained, and tonnage rates are inclined to strengthen a little, so that timber should be good holding until business is less hampered by industrial disputes, for there is much contracting work waiting to be carried out when normal conditions are restored.

British Columbian and Oregon Pine.—There is too much wood instock at present, and prices are lower. Quotations ahead have been reduced by a reduction in the rates of large sailing ships, and the outlook for the market in the immediate future is by no means satisfactory.

Prices current are quoted in the circular as follows:—

St. Lawrence Pine Deals, etc., per P.S.H.:	£	s	£	s
1st bright and dry, regular sizes	41		to	52
1st bright and dry, oddments	27		"	30
2nd bright and dry, regular sizes	26		"	29
2nd bright and dry, oddments	18		"	20
3rd bright and dry, regular sizes	15		"	18 10
3rd bright and dry, oddments	12		"	16 10

Ash Timber	40	6		
Yellow Pine Timber	902	766	284	131

Glasgow Market for Canadian Stocks

Calder, Henderson & Livingston, Glasgow, in their quarterly timber market report under date of April 1st, say:—

St. Lawrence:—There was no import of waney yellow pine during the quarter. As evidence of the extremely poor demand the consumption only totalled the low figure of 160 loads. In first class boardwood no business was transacted, notwithstanding the tempting inducements in price made by tired holders of stock. A small lot of prime Idaho wood out of a parcel that came forward from the Pacific Coast, and of a very attractive specification, was sold to a shipbuilder at a very cheap price. Only one or two minor sales at a low figure of 2nd class boardwood came under notice. Stocks are very heavy, and values of first class and second class, in view of the cheaper import cost of new shipments and also the poor outlook, have declined considerably and the tendency is toward still lower figures. Square.—Was never asked for. There is only a trifling stock.

The demand for elm has been quiet. Values of first class large size have been fairly well maintained. First class oak of good specification was in demand and realized firm prices. Stocks of this description are now pretty well cleared. The market is entirely bare of hewn birch logs and there are enquiries for 15-in. average and up. Planks have sold well and there are no stocks in first hands.

Pine.—Firsts—There were few enquiries and these were principally for undersizes. Some deals about 13 inch average were sold at from £40 to £41 per St. Pet. Std. No sales of regulars came under notice. A small lot of undersizes sold well at £31 10s. Good

Fraser Mills, B. C.

pine sidings were weak in value and were sold down to £28 17s 6d per St. Pet. Std. for 11 to 11½ inch average.

Seconds—Were in poor request. Broad deals sold at from £30 to £31 10s. No transactions took place in regulars owing to the absence of stock. Undersizes sold at around £20 12s 6d per St. Petersburg Standard.

Thirds—The demand was principally for regulars and a fair quantity was disposed of. Broad deals sold at from £19 5s to £20 5s; Regulars at £18 5s to £18 10s; Undersizes from £13 10s to £14 10s per St. Petersburg Standard.

Fourth—Broad deals were not enquired for. Quotations were around £13 10s to £14 10s. Regulars were slow of sale at from £13 5s to £13 15s per St. Petersburg Standard. Undersizes were neglected.

Red Pine.—The stock is very light, but is sufficient for the existing poor demand. 9 x 3 Merchantable quality is quoted at from £11 to £11 10s per St. Petersburg Standard.

Spruce.—Enquiries were not numerous, and were confined mostly to 9 inch and up, and values of these were firm. 7 and 8 inch Deals were quiet and prices were barely steady. The stock is mostly of narrow specification and although moderate is quite ample.

New Brunswick and Nova Scotia.—Birch—Logs—Arrivals were light but enquiries were not numerous, and although the stock is low it is sufficient for present wants. 14 inch average was sold at 21d per cubic foot.

Planks.—While stocks in first hands have been cleared, merchants have still a large holding, but values, however, have been fairly steady.

Deals and Battens.—Pine—A small shipment came forward and went to store. There is no outlet at present for this class of pine.

Spruce.—Arrivals were light. The demand has been disappointing and sales for the most part were of a retail character, buyers holding off in anticipation of lower prices. Values declined and the tendency is towards lower figures, principally in the narrow sizes. Deals 9 inch and up were in best demand and sold around £11 to £11 10s, the narrow sizes 7 and 8 inch from £9 10s to £9 15s per St. Petersburg Standard. The stock is moderate, but is ample in view of existing demand.

Retail Yard Management—Some Pithy Advice

By T. A. McAllister

The following advice in the form of a series of don't's" is the result of my experience after managing a retail yard for many years. Managers who follow out the following ideas will find their troubles greatly reduced.

1st—Don't neglect to keep in touch with general methods in the building trade.

2nd—Don't neglect to keep your stock well graded in the yard.

3rd—Don't crowd down your grades to make your prices compete with other lumber yards, as this is the first wave that will upset your business.

4th—Don't buy poorly sawn or manufactured lumber because you get it cheap.

5th—Don't promise a customer to fill a bill without a prospect of doing so.

6th—Don't let your stocks run down so that your customers have to go elsewhere to get their bills filled.

7th—Don't try to hold a troublesome customer.

8th—Don't neglect to establish a good collecting system.

9th—Don't help to support a lazy lawyer or collecting company at the expense of the hardworking customer.

10th—Don't neglect to advertise your business liberally in your own country lumber trade journal, as it is surprising how much confidence is placed in an advertising business, as compared with one placed in a general newspaper by builders, contractors and architects.

No doubt much depends upon where the yard is situated and how it is laid out for convenience, but I must say I have seen more trouble arising from the above-mentioned mistakes than from the inconvenient laying out of yards. The ordinary lumberman, in looking over a well laid out yard will keep it in mind better than he would the particular system of getting business and keeping it.

Trade Enquiries

The Dominion Government weekly Trade & Commerce report recently contained the following enquiry. The name and address of the enquirer may be obtained by writing to the enquiries branch, Department of Trade & Commerce, Ottawa, stating the number of the enquiry.

249. Veneer Panelling.—A London firm wishes for the addresses of Canadian firms who can contract to supply birch or maple veneer panelling in large quantities.

Lumber and the Panama Canal

That the importance of Douglas fir as a factor in Eastern markets will be very great after the opening of the Panama Canal, is apparent from the large amount of space which is being devoted to it in the general and the lumber trade press. The New York Lumber Trade Journal, in its latest issue, has an article with a great deal of interesting information upon this subject which we reproduce herewith:—

Douglas Fir

The Panama Canal will in course of time mean more to Douglas fir than to any other single article of commerce. No other commodity is likely to constitute so large a percentage of the total volume of traffic through the new water route as this product of Washington, Oregon and British Columbia.

Lumber now ranks third in point of quantity transported by rail and water, coal and iron ranking first and second respectively; but in the movement of freight through the canal lumber will undoubtedly take first place in time, and of the many varieties of the product that will be carried from ocean to ocean, Douglas fir will exceed any other in bulk. The grounds for making this prediction are reasonable. The estimated stand of Douglas fir timber in the United States is greater than that of any other soft wood and more than the combined stands of all the hardwoods. According to United States Government Forest Service reports the available supply ranges from 300 billion to 350 billion feet, a supply which at the present rate of yearly consumption of Douglas fir (5 billion feet) will last for sixty years or more.

Douglas fir is considered as perhaps the most important of American woods. Though it ranks second to Southern Yellow Pine in point of quantity manufactured, in the variety of uses to which it can be put it now has first place. Fir to the far West is what white pine is—or rather has been—to the East, useful for almost every purpose for which wood can be used. White pine would continue no doubt to hold supremacy in its wide scope of usefulness did not its vanishing sources of supply and consequent high price tend to greatly restrict its field.

It Grows

Douglas fir grows in ten States of the Union and is known by as many names. In the East and in foreign countries it is best known by the name of Oregon pine, in California it is called spruce; it is also referred to as Douglas spruce, Washington fir, Oregon fir, red spruce, Puget Sound pine, and British Columbia pine; also as we shall read later by the names of red fir and yellow fir. But the name used more than all others is "Douglas Fir."

The species is most abundant and attains its largest size and greatest importance for commercial purposes not far above sea level in Southern British Columbia and between the coast of Washington and Oregon and the western foothills of the Cascade Mountains. The trees in this territory grow to a height of from 200 to 300 feet, close together, the fir, mixed here and there with hemlock and cedar, forming very dense forests that yield from 35,000 to 60,000 board feet per acre, and frequently as much as 100,000 feet or more. Indeed, some acres will cruise as high as 500,000 board feet to the acre. When compared with the average of perhaps not more than 6,000 to 8,000 feet in other sections of the country, these figures seem incredible; and yet when it is known that a single fir tree has scaled as much as 60,000 board feet and that frequently a tree will yield as high as 15,000 feet or more of lumber, it is not difficult to understand how these immense acreage totals are reached and that a comparatively few trees within the area of an acre will make a surprising acreage. It may be interesting here to refer to some actual measurements recently made in a Puget Sound logging and milling operation. The logs from four Douglas fir trees taken at random were measured, not particularly to ascertain the total footage in the trees, but to arrive at the taper and number of feet in each log. Hence while the following figures do not indicate the full height of the tree nor the actual number of logs sawn from them, they will serve to illustrate the lumber contents of the general run of logs:

Tree No. 1—Three logs scaled a total of 4,520 feet. Diameter at butt, 42 inches; top diameter at 104 feet, 28 inches.

Tree No. 2—Three logs scaled 7,114 feet; butt diameter 52 inches; top diameter at 104 feet, 34 inches.

Tree No. 3—Four logs scaled 10,880 feet; butt diameter, 60 inches; top diameter at 136 feet, 34 inches.

Tree No. 4—Four logs scaled 14,973 feet; butt diameter, 72 inches; top diameter at 104 feet, 40 inches.

Red and Yellow Fir

There is a wide variation in the character and grain of Douglas fir. In color it varies from a reddish-brown to a clear yellow, and in grain it may be coarse, medium or fine. The diameter growth of the tree for the first fifty or one hundred years is rapid, resulting in a coarse grain wood, while the later stages of growth are as a rule

*The rain may drizzle, pelt or drip :

slower and result in a fine grained wood. Because of these decidedly different characteristics, Douglas fir is divided by lumbermen into two classes: Red fir and yellow fir. Red fir, of a reddish tinge in color, has a coarser grain than yellow, and is usually obtained from second growth timber or from the heart of older trees.

Yellow fir is usually close grained, soft and fine in texture, comes from the outer portion of mature trees, and runs into a larger percentage of clear lumber.

Red fir is the wood most commonly used for structural purposes and in the merchantable grade is slightly stronger than yellow fir.

The results of a number of government tests show the percentage of select grade in red fir to be 34, in yellow 48. Merchantable grade, red 34, yellow 35. In seconds, red 27, yellow 17.

This indicates that as a rule yellow fir contains fewer defects than red. The yellow fir has an average of 15 annual rings of growth to the inch, while red fir has an average of 9. The rate of growth therefore in yellow fir is considerably slower and more uniform than in red. The rings of old growth yellow fir are so close together in many instances that it is impossible to count them without a microscope.

As many as 700 rings have been counted on a single stump, and no doubt trees may be found that reach an age of more than 700 years. There are whole forests of trees averaging 5 feet in diameter and some may be seen as large as 15 feet. The trees near the coast, which are 200 years old, average 200 feet in height and have a diameter breast high of not less than 36 inches. From this growth may be produced timber and plank clear of knots and other defects for 100 feet in length.

We call attention to these differences between red fir and old growth fir for the reason that they roughly mark the time between the material that is largely used for structural timber and the beautiful grained material that has such exceptional qualities for interior trim and other forms of lumber, for which it competes with high-class pine. It might be truly said that it is because of these widely different features in the same wood that Douglas fir can be put to such varied uses.

Strength

The United States Government Forest Service has made many tests of the strength of Douglas fir. Tests on bridge stringers indicate that red fir in dimension sizes is slightly stronger than yellow, while the tests on car-sill sizes and small clear specimens show a slight increase in strength for yellow fir. The difference in strength, however, is not enough to warrant a discrimination in favor of either red or yellow fir.

Reports of the Forest Service state that Douglas fir as a structural timber is not surpassed, and though it stands second in breaking strength to long leaf pine, it is considerably lighter in weight.

The average results secured from the tests on Douglas fir and of those on other structural timbers is shown in the table given below. Large-sized green timber was used in all of the tests upon which this table was based except for longleaf pine, which was partially air dried, and this fact explains in part the apparent superiority of longleaf pine over Douglas fir.

Species	Bending Tests		
	Fiber Stress at Elastic Limit, Lbs. per Sq. Inch	Modulus of Rupture, Lbs. per Sq. Inch	Modulus of Elasticity, 1,000 Lbs. per Sq. Inch
Longleaf Pine	3,800	7,200	1,560
Douglas Fir	4,000	6,000	1,510
Loblolly Pine	3,200	5,600	1,430
Short Leaf Pine	3,300	5,600	1,470
Western Hemlock	3,700	5,600	1,320
Western Larch	3,500	5,400	1,410
Tamarack	2,800	4,600	1,220
Norway Pine	2,600	4,000	1,190

Grouping these species according to their breaking strength, we find that Douglas fir and longleaf pine are the strongest; loblolly pine, shortleaf pine, western hemlock and western larch form an intermediate group, and that Norway pine and tamarack are the weakest.

In the quality of weight the marked difference between the longleaf pine and Douglas fir may be noted in the following table.

All wood contains moisture in varying quantities. Green Douglas fir may contain as much as 10 pounds of water per cubic foot. In comparing the weights of various woods it is necessary therefore to reduce them to the same moisture content.

Species	Weight per Cubic Foot, Pounds	
	Air Dry Weight Lbs. per Cu. Foot	Kiln Dry Weight, Lbs. per Cu. Foot
Longleaf Pine	41	36
Douglas Fir	33	29
Loblolly Pine	36	31
Shortleaf Pine	35	30
Western Hemlock	32	28
Western Larch	35	30
Tamarack	35	30
Norway Pine	29	25

Other Qualities

While Douglas fir stands at the head of the woods in the matter of weight and tensile strength, it also has other qualities which commend it for structural purposes. The durability of the timber compares favorably with other species, since the trees have a comparatively small amount of sap wood and practically all structural timbers are cut from that portion of the tree nearest the heart. Douglas fir is practically free from shakes, and checks are only occasionally encountered in green timber, although they develop as the wood seasons. When it checks from drying the strength of the timber is not reduced below what it was in a green condition, since the increase in the strength of the wood due to seasoning more than offsets the weakening effect of the checks.

Large and Long Sizes

In the production of large spars, dredger spuds, long piling and tall flag poles, Douglas fir is not equaled by any other wood in the world. It stands in a class by itself. From what other species suitable for these combined purposes could be produced a mast 120 feet in length and 36 inches in diameter at the deck, or a spud 36 inches by 40 inches and more than 90 feet in length, or immense quantities of piling, ranging from 80 to 110 feet long, or a flagpole 220 feet tall and about 22 inches square at the butt? These figures are taken from sticks actually logged, manufactured, shipped, delivered and erected for the purposes named.

The opening of the canal and the use of steamers built especially for carrying lumber will enable unusual lengths and sizes to be brought to the Atlantic Coast to better advantage and at much less cost than heretofore, and it may be safely predicted that the demand for Douglas fir for these particular uses and for timber generally will have a rapid and substantial growth.

Piling and Poles

The long, straight, slightly tapering trunk of Douglas fir and its strong, resilient and durable qualities particularly fit it for use as a pile timber and for poles. As the supply of cedar poles diminishes and a satisfactory butt preservative treatment is found for Douglas fir, it will probably be substituted for cedar, although even now it is used to a considerable extent for telephone and telegraph poles, and in cities, where utility and handsome appearance are combined, large and attractive sawed poles of fir are in use on many street car lines.

Douglas fir is frequently preferred to all other available species for mine timbers, because of its durability, lightness and strength, and it is used for this purpose as far East as Pennsylvania and in foreign countries.

Lumber Manufacturing Methods

By G. D. Keller

One of the most skillful sawmill men in the country, who was recently discussing that business, made the statement that most lumber just happens, instead of being manufactured. He took the ground that the average sawmill does not produce anything like the quality of lumber that it should, and that this is caused by reason of the fact that most of the attention is given merely to keeping the saws going, instead of getting the best possible results out of every log that is put on the carriage. While his indictment of sawmilling methods is probably not true as regards many of the lumber manufacturers of the country, the fact that there are many former sawmill men who have found it more profitable to confine their efforts to the timber business, without attempting to operate a mill, suggests that there must be something in his beliefs.

The main trouble, according to most sawmill experts, is that the sawyer is not enough of a grader. In other words, he is not taught to work with the end in view of producing the best, and not necessarily the widest, lumber. Sometimes, it is pointed out, the widest stock is the cull lumber, whereas this should be the narrowest, showing that proper attention has not been paid to this detail of manufacturing. The temptation to cut the log as far as possible on one side without turning is responsible for this condition. If proper care is taken to look for indications of the knot or other defect which will reduce the grade of the lumber, the log can be turned before the knot is opened, and thus the grade of the lumber will continue high.

Another point where errors are frequently made is in giving instructions to the sawyer to manufacture a given quantity of a certain thickness. It frequently happens in cutting a log that one dimension will be found better, as far as getting quality lumber is concerned. If iron-clad instructions are given and the sawyer has no choice in the matter, he is frequently compelled to produce boards which are below the grade it was possible to have secured from the log being cut up.

On the other hand, there are certain practical objections to this

plan which make it impossible to allow the sawyer as much leeway as many think he should have. The labor of sorting a large number of thicknesses after they have been cut would add greatly to the expense of running the mill, and it is a question as to whether the increased value secured would more than offset the handling charges. Nevertheless it would seem to be fairly easy to demonstrate that the man at the saw should have enough leeway to be able to avoid the obvious error of making a poor board when he can get a good one simply by changing the thickness.

Logs Should Be Sorted

References have been made before to the desirability of sorting logs before manufacture. Some sawmill men assert that they cannot afford to do this, and that they have to manufacture the lumber just as the logs are piled. This results in oak, poplar, chestnut and ash logs being brought on one after the other, and in the expense of handling being much greater, since the stock has to be sorted to varieties as well as to grade. This disadvantage would be overcome by a traveling derrick, and while the expense of this equipment is considerable, it is likely that the increased facility of handling would pay for it in a short time.

However, the principal point to be considered in connection with bringing all kinds of logs to the saw without being sorted is that no saw can be expected to do good work, or at least its best work, under those conditions. Things may be adjusted splendidly to cut oak, but if a hickory log is put on the carriage next, or a poplar log is brought forward, it is certain that equally good results are not going to be experienced. The sawyer who is constantly confronted with a condition of this kind can hardly be blamed for getting discouraged.

It makes a good deal of difference how a log is brought to the saw. If a band mill is being operated, the small end of the log should be brought against the saw first, as in this way it gets a better start into the log. On the other hand, a circular saw has been found to produce better work when the butt end of the log is struck first. This is a simple distinction, yet it is not always observed.

A lot of lumber is wasted by unintelligent handling of the edger and trimmer. These two machines can save and make a lot of money for any mill by raising the grade of the lumber, yet it is the exception rather than the rule to find the best men in the mill operating them. Usually it is considered sufficient to have anybody who can perform the purely mechanical work of handling these machines, the best men being reserved for the work of sawing. This is a mistake, and one which could be corrected with excellent results.

Some mills, however, have solved this problem rather well by having their lumber graded immediately after it passes through the edger. In other words, the inspector measures the board, determines whether it should be trimmed or altered in any other way so as to improve the grade, and then sends it on into the yard. The usual way of having it go to the edger and trimmer, and then to the grader generally is ineffective, for the reason that it is a good deal of trouble to lay out a plank and send it back into the mill for resawing. The proper place to determine how the grade can be improved is while it is at the machines where this work can be done. The arrangement of the machines so as to enable the inspection to be made is sometimes difficult. Usually, by having another man whose duty it is to turn the board so the inspector can measure and grade it without having to turn it over with his rule, the difficulty attached to this is eliminated.

Odd Length Trimmer an Important Man

The education of the man in charge of the odd-length trimmer is an important feature, to which too much attention cannot be given. It takes practice and intelligence to operate an odd-length machine to advantage, and to give the manufacturer the best results from his material. In some cases sawmill men have been tempted to discard this machine because they have been unable to get the right kind of operation, but the better plan is to pick out the best man it is possible to get, and then give him plenty of instruction in the importance of the proper operation of his machine. The use of the odd-length trimmer will save many a board from being graded down, and will, when carefully operated, make enough money for the plant where it is used to pay for itself in a comparatively short time.

Referring again to the fact that the character of the log should be studied and the best stock it is possible to make under the circumstances taken out, the sawyer who can solve the problem thus presented by every log which comes before him is a valuable man. Not long ago a prominent manufacturer, who had secured a large tract of oak timber and installed a mill, had given instructions to manufacture all of it into 1-in. plain oak. It so happened that when the logs began coming into the mill it was discovered that on account of their having been attacked by worms, nothing but cull lumber would be produced if the original plan were followed out. There was a conference of the superintendent, the sawyer and the chief executive of the concern, and after discussing the various ways of get-

ting around the obstacle, it was decided to manufacture bill oak instead. It happened that the price on this character of stock began to rise about that time, so that the sawmill man made good money on the output. If he or his men had gone blindly ahead and manufactured plain oak, cut in 1-inch thicknesses, the operation would probably have resulted in a decided loss. This is an extreme case, and probably does not happen often; but it goes to show that the proposition should be studied and the question asked, "What kind of lumber should this log be cut into?"

Frequently a swell-butted log comes into the mill and the question arises as to how to handle it. Experience has shown that the best way is to saw exactly parallel with the outside of the log, instead of parallel with the line of the heart. The reason for this is plain. The defects, shakes and rotted portions of such a log are almost certain to be found at the large end. Consequently the portion wasted by sawing in the manner indicated will be the pyramid formed by the angles at the bottom of the log. In other words, such a method will cause the manufacturer to lose the portion of the log which would make his lumber defective if it were used. There is bound to be waste somewhere on a log of that character, and the point is to put it where it will do the least damage.

Quarter Sawing a Fine Art

Quarter-sawing oak lumber has gotten to be a fine art. The sawyer who knows just how to attack a log in quartering, so as to get the best results, can usually get a job anywhere. It is a difficult piece of work, and for this reason many practical sawmill men agree that there should be a man, picked for the job because of his expertness, whose duty it would be to examine every log intended for quarter-sawing, and select the points at which it is to be cut. In this way all cracks, shakes and knots would be dodged as much as possible, so as to make these defects come in the narrowest lumber. By this plan the ends of the logs would be marked as they came on the mill deck, so that the flitches would be split off in such a manner as to make the most of the opportunities presented. That a plan of this kind would improve the grade of lumber there seems to be no doubt.

The cutting of thick lumber is also a difficult job when the question of keeping the grade up is considered. The flitch should be carefully watched for signs of the underlying defect which will be opened up at the next cut, and turned down when it becomes apparent that a common board would be made if it were to be sawed another time on the same side. After thick lumber is manufactured it is frequently not taken good care of, but is allowed to warp and check so as to destroy a large part of its value. The better plan is to go to the expense necessary to cleat the ends, especially in hot weather, when most of the damage is done, and to board up the ends of the piles to keep the air from circulating too freely. This precaution will keep the stock in good condition, and when it is realized that depreciation on thick lumber means a more rapid loss than on other dimensions, the importance of the plan is understood.

The purely mechanical end of the sawmill's operations should not be underestimated. That is to say, it is necessary to keep one's saws properly filed, to have them properly adjusted and to have the carriage in good shape. But, on the other hand, it is equally necessary that those operations which have to do with the grade of the lumber manufactured be given attention. It makes no difference how perfectly manufactured a board may be, there is a loss to the owner of the mill if it is a common board when it might have been a first or second. The properly-run mill will combine the exactness of manufacture (which should be constantly sought) with the intelligent application of the principles of selection, so as to get lumber which is not only truly made, but which is the best lumber that it was possible to produce from the logs which were cut.—G. D. K. in *The Wood-Worker*, Indianapolis.

Will of the Late Wm. Gillies

Probate has been granted by the Surrogate Court of Ontario of the will of the late Wm. Gillies, well-known lumberman and manufacturer, of Carleton Place, Ont., who died in Toronto in September last, leaving an estate valued at \$210,460. The principal items consist of book debts, promissory notes, cash, etc., \$93,270.50; bank and other stocks, \$81,530; life insurance, \$8,560; real estate, \$25,100. The whole estate is bequeathed to numerous relatives and friends.

Henry Disston & Sons, Inc., Philadelphia, Pa., report that Mr. Frank Gould severed his connection with them on April 20th. For some time past Mr. Gould was sales manager of the hardware department.

John L. Palmer, senior member of the firm of the Palmer Medical Company, Limited, Windsor, Ont., manufacturers of Stewarts Veterinary Remedies, is again on his old territory, calling on the lumbermen and contractors.

Say ! Superintendent

Have you ever figured
the saving a

Linderman Dovetailer

would effect for us?

LET US FIGURE FOR A FEW MINUTES:—

We cut annually about M. feet of 4-in. common strips, average price per M. \$....., which totals... .. \$———
8-in. and 10-in. shiplap brings \$..... per M. If all 4-in. strips were worked into 8-in. and 10-in. shiplap we would receive \$———

GROSS PROFIT \$———

COST OF JOINTING ON A LINDERMAN DOVETAILER 75c per.....
M.; cost of matching and handling, 50c per M. M. feet at \$1.25 per M. \$———

NET PROFIT \$———

BESIDES, we cut M. feet of 4-in., 6-in. and 8-in., No. 3 grade lumber for which we receive \$....., but for our 10-in., 12-in., 14-in. and 16-in. No. 3 Grades we average \$..... per M. If all were made wide we would receive \$.....; cost of joining and handling \$1.00 per M. \$.....

NET INCREASED PROFIT.. \$———

BESIDES, if we had a LINDERMAN we could cut 2-in., 2½-in., 3-in. and 3½-in. strips instead of leaving them in the slab. We should get about M. feet. In the slab they are worth about \$..... In lumber they are worth about \$..... It will cost about \$1.25 to join and handle \$.....

NET PROFIT ABOUT \$———

BESIDES, we could work all our shorts into full 16-ft. lengths; make grain doors and save 10 per cent. of edging waste, work in our short shorts, besides using the machines for other purposes.

What say you Superintendent ?

SHALL WE WRITE THE LINDERMAN PEOPLE AND INVESTIGATE?
It looks as though we are losing money. Let us send this information to the

EDGINGS

Ontario

F. Menard, lumber manufacturer, of Sturgeon Falls, Ont., is putting up a new circular sawmill at Field, on the Sturgeon River, on the line of the C. N. O. Railway.

A report was recently published to the effect that Geo. A. Watson, Flesherton, Ont., intended to erect a plant at Markdale. Mr. Watson advises us that this is incorrect.

John Harrison & Sons Company, Limited, Owen Sound, Ont., report that they have taken out about 35 per cent. more logs during the past winter than usual. They manufactured about 10,000,000 feet.

The Hydro-electric Commission of Ontario will probably purchase about 2,000 cedar poles of various lengths from 25 to 50 ft., for use at Windsor, Ont. The chairman of the local board is D. Bowlby, 32 Sandwich Street West, Windsor, Ont.

The Elora Furniture Company, Limited, has been incorporated with a capital of \$40,000, with head office at Elora, Ont. The provisional directors are J. E. Walser, F. Daub, O. C. Schmidt, P. Daub, and S. B. Jeanneret, all of Elora, Ont.

Work has been commenced at Stratford, Ont., upon an addition to the Kalbfleisch Planing Mill. The cost of the addition will be \$2,500 and it will be 49 x 86 ft. The equipment will include hoisting and covering machinery. The manager is Mr. E. Kalbfleisch.

The Brantford Piano Case Company, Limited, has been incorporated with a capital of \$100,000, with head office at Brantford, Ont. The provisional directors are M. S. Phelps, Rochester, N.Y., and W. D. Schultz, J. Ruddy, J. H. Ham and S. M. Burnley, Brantford, Ont.

A report was recently published to the effect that the Pembroke Lumber Company, Pembroke, Ont., had sold berths No. 1 and No. 2 in Jocks Township, Ont., to J. J. McFadden, of Renfrew, Ont. The company report that this was an error and that they have "purchased" not "sold" these berths from J. J. McFadden.

The Interior Hardwood Company, Wilmot Street, Berlin, Ont., have commenced work upon an \$18,000 addition to their plant. The addition will be five storeys, 160 x 50 feet, of red pressed brick with stone foundation. It will contain pine floors and wood lath. The plant will be equipped with additional woodworking machinery.

The Haight & Dickson Lumber Company, Limited, of Sudbury, Ont., are putting in a new circular mill with a capacity of 15,000 to 18,000 feet per day at Green's Siding, District of Sudbury, on the C. N. O. Railway, which will be ready to start cutting about the end of May. Their other mill located at North Star Mines on the A. E. Railway, with a capacity of 14,000 feet per day, will start cutting May 1st. This company will cut upwards of three million feet this season, nearly all of which will be pine, with a little spruce. The head office of the company is at Sudbury.

Eastern Canada

Messrs. Blair & Rolland have removed from 234 to 130-131 Coristine Building, Montreal.

The partnership between Trudeau and Despariais, lumber merchants, of Sherbrooke, Que., has been dissolved.

William Copping, Joliette, P.Q., reports that he has nearly completed the erection of his sawmill and expects to commence operations early in May.

The firm of Rainville & Robichaud, sash and door manufacturers, of Montreal, has been registered. The members are J. L. Rainville and J. S. Robichaud.

The sash and door factory belonging to Evans and Tite at Bishop's Crossing, P.Q., was recently destroyed by fire. The mill and machinery are a total loss, which was partly covered by insurance. The plant will be rebuilt.

Tenders have been invited for the purchase as a going concern of the business of the late Mr. J. H. Redfern, Montreal. The lumber in the yards totals 3,000,000 feet, while that at the mills amounts to a further 1,400,000 feet. There are also contracts calling for the supply of 1,850,000 feet.

The North Shore Power Railway and Navigation Company, 125 St. Peter Street, Quebec, who operate a large plant at Clarke City, P.Q., have given notice that they will apply during this session to Parliament for an act changing their name to the Gulf Pulp and Paper Company and to authorize them to carry on the said business anywhere in Canada.

The Bathurst Lumber Company, Limited, Bathurst Village, N.B., are constructing a first class dressing and resawing plant at Bathurst Village and hope to have it going by the 1st of June. The mill will be equipped with the S. W. Woods Company fast matchers and with the Mershon resaws. The blower system will be installed by the Allington & Curtis Company, of Bos-

ton. The mill will be driven electrically from power manufactured in the company's plant. The shavings and sawdust from this plant will be blown to the main boilerhouse for fuel, a distance of about 800 feet. The whole plant will be up-to-date and first class, and the company say that it will be the finest of its kind in Eastern Canada. The foundations will all be constructed in concrete and the entire building will be covered with metal.

A despatch from Amherst, N.S., says: A large transfer of timber land was put through by I. J. Soy, of Amherst, recently, whereby some eight thousand acres on the eastern side of what is known as the Economy River Division and belonging to the Nova Scotia Lumber Company, was sold to Mr. J. H. Livingstone, of Wentworth; Mr. Charles Hill, of Truro, and Mr. Starrett, of Bass River. Mr. W. J. Gillespie, of Amherst, is largely interested in the Nova Scotia Lumber Company and with him are associated Mr. J. W. Seaman and Mr. Prescott, of Walton; Mr. Samuel Freeman, East Amherst, and the estate of the late Honorable W. T. Pipes. It is understood that the purchasers have an option on a further two thousand acres of this same property until June 1st. The price is not mentioned but it is rumored to be in the vicinity of seven dollars per acre.

Western Canada

The Pine Tree Lumber Company, Limited, has been incorporated with a capital of \$10,000, with head office at Munson, Alta.

The Mitchell Lumber Company, Limited, has been incorporated with a capital of \$25,000, with head office at Vancouver, B.C.

The Hunting, Merritt Lumber Company, Limited, has been incorporated with a capital of \$100,000, with head office at Vancouver, B.C.

Lutz and Krans, Limited, have been incorporated with a capital of \$100,000, with head office at Victoria, B.C., to carry on business as timber merchants.

The Alberta Lumber Company, Vancouver, B.C., recently lost its plant at False Creek, by fire. The loss amounted to about \$100,000 upon the plant and \$50,000 upon other buildings and timber.

The Provincial Government of British Columbia has sold to the British Columbia Sulphite and Fibre Company, who own a pulp mill at Howe Island, B.C., 1,070 acres of timber on the Sutej Channel. The company will undertake to have the area cleared in three years. The holdings comprise 6,000,000 feet of hemlock, 2,000,000 feet of larch and 3,000,000 feet of cedar.

Burnaby municipality, B.C., will shortly have in operation its first shingle mill on the North Arm of the Fraser River when the Shull Company, an American firm with mills in Everett and Portland commence erecting a plant in D. L. 161. This mill will be on the Eburne line of the B. C. E. R. near the South Vancouver boundary and below Riverway. Although Burnaby has numerous mills on Burrard Inlet this is the first one to be erected on the Fraser in the municipality. This plant, which will have twenty-five machines, will be able to turn out half a million shingles a day, employing fifty hands with a monthly pay roll of \$15,000.

Yellow poplar, or tulip tree, the largest broadleaf tree in America, has been known to reach nearly 200 feet in height and 10 feet in diameter.

Hickory is the strongest Canadian wood. When properly seasoned a hickory column will support a weight of twelve tons per square inch cross-section, which is considerably more than what could be borne by a pillar of cast iron or steel of the same length and weight.

A Vancouver lumberman has estimated that "one ton of refuse goes to the burners for every thousand feet of lumber cut." In his own sawmill he has eliminated this waste by breaking-up the refuse into small pieces which are manufactured into fuel briquettes at a cost of only \$3 a ton.

Mr. C. B. Thorne, manager of the Hawkesbury mill of the Riordon Pulp and Paper Company, Limited, has gone to Europe. It is the policy of the Riordon Company to send a man to Europe every three or four years. Mr. Thorne will remain there four months studying conditions and new methods in Germany, Scandinavia and England.

Wistar, Underhill and Nixon, wholesale lumber dealers, Real Estate Trust Building, Philadelphia, Pa., have sent a very useful calendar for the year 1914, to their friends in the trade. The calendar pad is in the form of separate sheets for each business week, each sheet being sub-divided into six sections, upon which is sufficient space for jotting down memos, engagements, etc.

At the annual meeting of the Canada Lumber Sales Company, Limited, Montreal, it was reported that a first dividend on the preferred stock, of 8 per cent., and a first dividend of a similar amount on the common stock, had been declared. It was also decided to increase the capital stock by \$25,000.

German pencil manufacturers are looking to California incense cedar for pencil wood.

Belting for Special Work

can be used in temperatures up to 250° Fahrenheit, and is proof against most chemicals met with in manufacturing.

It is also unaffected by moisture.

Write us for our book on complete Belting information.

Let us lift you
above roofing
competition

There is no money in ordinary roofings that have to be sold at cut prices. Your profits are so small that it scarcely pays to handle them.

Let us place you above unjust, ruinous, cut-price competition by appointing you our exclusive dealer in your town for

JM ASBESTOS ROOFING

When you sell this roofing you make big profits because you don't have to cut your price. And you practically get a monopoly of the roofing business in your territory because J-M Asbestos Roofing is different from all other roofings.

Made of alternate layers of Asbestos felt and Trinidad Lake Asphalt. Contains nothing to rot or deteriorate. Gives perfect fire protection. And on account of its all-mineral character, never requires coating or graveling.

We are also prepared to furnish J-M Regal Roofing, the highest grade rubber roofing on the market, and lower in price than J-M Asbestos Roofing.

Write today for Special Dealer Proposition.

The "Belting Manual"

fresh from the press tell how to :

- Install Belting.
- Care for belting.
- Repair laps.
- Make belts endless on the pulleys.
- Lace belts.
- Clean belts.
- Remedy some of the belt troubles.
- Find the width and lengths of belts.
- Find the Horse-Power of belting.
- Find the speed of belting.

The fifteen pages of mechanical rules and tables are unusually complete and compiled expressly for use in solving the daily problems of Power plant practice.

In short, the "Belting Manual" is a veritable fund of practical belting information—the latest and most authentic book of its kind.

Just take a minute to send the coupon—to-day.

When
You
Overhaul
Install

“Acme Waterproof” Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with “Goodhue Belts” and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

Get our details and prices.

A New Swage The Best Yet United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it “The best yet.”

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

Newburgh, Ontario

Disston Steel and Disston Saws

Look for this Brand

Reg. U. S. Pat. Off.

The foundation of the efficient and durable saw is the steel from which it is made.

Expert workmanship carrying out proven designs as to shape of teeth, etc., cannot build a lasting, smooth cutting saw without the foundation of a suitable steel to work upon.

It is chiefly to the extraordinary success of the Disston Plant in producing a superior steel for the purpose that may be attributed the rapid growth and steady demand for Disston Band and Circular Saws.

When the Disston Steel Works were established in 1855 a new era in saw making began. It was not only the first plant of its kind in America, but the first anywhere in the World to produce a perfect saw steel—a steel possessing the peculiar qualities necessary to the manufacturing of a perfect saw. The Disston Steel Works are in charge of an expert who thoroughly understands the requirements of a perfect saw steel and the making of Disston Steel to meet those requirements. Under his supervision are other experts who have, through constant invention and experiment, continued to improve this famous steel.

Disston Steel can never be duplicated, and that is one of the principal reasons why Disston Saws will retain their superiority for all time.

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . . 2 3/16 by 55 inches
Size Drive Pulley 20 by 10 inches
Feed per Revolution of Saw 0 to 3 1/4 inches
Feed Belt 4-inch Gandy
Largest Diameter Saw 56 inches
Length of Carriages 12, 16, 20 or 24 feet

Width of Carriages 33 inches
Trucks 7-inch wheels and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks C1-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Griplock Riveted Chain Belt

Section of Griplock Riveted

No More Breakdowns—No More Delays

This is the slogan that users of **Griplock** Chain Belt have adopted. No hooks to be opened up, no breaking of chain belt in **Griplock**. **Griplock** is so constructed that it will withstand the severest kind of service. It is built by the Chain Belt Company, Milwaukee, Wis., a concern that fully understands the requirements of the Lumber and Saw Mill Trade.

We would be very glad to mail you sample links for your inspection.

MONTREAL, P.Q.

FAY-EGAN "LIGHTNING" No. 333 Planer and Matcher--the foundation of many time, labor and lumber saving installations.

The "333" itself forms the cost cutting installation of many up-to-date Planing Mills throughout the country—it will reduce manufacturing costs 40 to 50% and raise grade of lumber 10 to 30% as compared to the old style matchers—but in most cases, the "333" with either Horizontal Band Resaw or Profiler forms the Planing Mill men's ideal.

The cut in manufacturing cost is even greater with one of these combinations than the almost unbelievable economy of the "333" itself.

A 333-335 Matcher-Resaw, with Resaw below the bedline of the matcher will work bevel siding, ship-lap, etc., double thick and resaw at 200 ft. a minute. A 333-288 Matcher-profiler will work ceiling, novelty siding and other formed stock at Fast Feed Matcher speeds. In both cases the machine takes rough stock and finishes it in one operation even more perfectly than when put through separate machines. A 334 Automatic Feeder added to any of these units keeps it full and each piece butting, insuring maximum production every hour.

Every lumberman is more or less acquainted with the Modern Fast Feed High Duty Matcher and Surfacers. However, we have had printed a thorough treatise on this type of machine,—in fact, it seems just like taking one apart in your own office. The combinations of the "333" and all the appliances for Fast Feed Machines are also shown and described in detail. Send us the coupon—nothing more—and we will send this Book.

Engineers all over the world like Cling-Surface.

Here is an example from Africa.

Cling-Surface meets with universal approval from the tropics to the Arctic. Mr. N. Jordan, a consulting engineer, of Lorenzo Marquez, East Africa, writes us as follows:

"I have had 5 years' experience with Cling-Surface here and have recommended it with success.

"I first tried Cling-Surface on wood-working machinery having 48-in. saws, running on 14-in. pulleys driven from 36-in. pulley on the countershaft on 20-ft. centers. I gave the belts 10 in. slack to start and had them kept clean. On account of the sawdust I feared the slack would be too much, but they ran splendidly and appear little worse for five years' wear.

Operators of woodworking machinery know how difficult it is to keep the belts free from sawdust and shavings. A sticky preparation here would only make matters worse. Mr. Jordan appreciated that and used Cling-Surface because it acts from the inside of the belt to impart the pliability and gripping power. Of course, dirty or dusty places necessitate some special belt attention, but with reasonable care and Cling-Surface in the belt, operation will be very good under the severest, dirtiest conditions.

True belt economy demands Cling-Surface and the sooner you make the trial, the sooner you will realize the truth of all our claims. The cost of a trial package of Cling-Surface is insignificant in comparison with the benefits and it costs nothing unless you are satisfied.

Ask for literature. We quote f. o. b. Toronto.

CLYDE IRON WORKS

Duluth, Minnesota, U.S.A.

Are your horses of use to you?

This seems an absurd question—and the answer is always
"Of course they are"—In which case provide your stables with:

Johnson's Reliable Veterinary Remedies

Johnson's Horse Liniment, No. 1 (Alcoholic)

1 gal. jugs (Imperial)	\$4.50 gal.
1 lb. bottles	8.00 doz.
2 lb. bottles	15.00 doz.

Johnson's Horse Liniment, No. 2 (an oil liniment)

1 gal. jugs (Imperial)	3.00 gal.
1 lb. bottles	6.00 doz.
2 lb. bottles	11.00 doz.

Johnson's Horse Colic Remedy

A sure and speedy cure for all kinds of Colic	
1 gal. jugs (Imperial) 40 doses	5.00 gal.
1 lb. bottles 4 doses	8.00 doz.
2 lb. bottles 8 doses	15.00 doz.

Johnson's Veterinary Healing Ointment (Gall Cure)

2 lb. tins	2.00 per tin
4 oz. tins	3.50 doz.

Johnson's Condition Powders (Concentrated)

1 lb. Packages	3.60 per doz.
----------------	---------------

Johnson's Camp and Household Remedies, such as Cough Syrup, Healing Ointment, Headache Powders, Big 4 Liniment, Stomach Bitters, Cathartic Pills, etc., etc., have stood the test of twenty-five years and are in use all over Canada, from the Atlantic to the Pacific. Prices are lower than those of all other manufacturers. Letter orders receive prompt attention.

A. H. Johnson, Wholesale Druggist, Collingwood, Ont.

Are Your Horses in Good Condition?

Horses for all lumber work are subjected to the hardest hauling under the most severe conditions. They should therefore be as fit as all possible care and attention can make them.

**In the Lumber Camp,
Around the Mill, In the Yard**

and wherever lumber has to be hauled the horses are always liable to a multitude of small injuries which if not attended to promptly may develop into lameness or disfigurement, thus reducing the working capacity of the horse and impairing its value from a sale standpoint.

You should always have handy and ready for use

Good Liniment

to reduce bruises, strains, soreness; allay pain and inflammation quickly, be an antiseptic dressing to a cut or burn, or to heal a wire cut, wound or laceration.

ABSORBINE

is an antiseptic healing preparation as well as a resolvent and a discutient. It will assist nature in bringing about a dissolution of the bunch, restore the circulation, gradually restoring the part to its normal condition.

It will produce permanent and complete results without blistering or removing the hair, and will leave no blemish. You can work the horse at the same time.

All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 per bottle at dealers or express prepaid. Manufactured only by

W. F. Young P. D. F.

MONTREAL

Provide for the Future NOW!

In every lumber manufacturing section of North America are to be found crumbling ruins of mills whose owners elected to depend on the open market for their log supply, who refused to invest their good money in standing timber.

In practically every case the "Open Market" has proven an unreliable source of log supply. Farseeing operators have come in, sized up the supply of timber tributary to certain points and bought the bulk of it. Many of the mill owners who had the first and the best opportunity to purchase, because of their neglect, have been forced out of business and have seen their investment in plant and equipment depreciate to the extreme low limit of its value as junk.

Does that possibility confront you?

If it does, please bear in mind these facts:

Now is the time to provide for your future supply.

We can give you exactly what you need.

Your copy of "Washington Red Cedar, America's Overcoat Wood," Lumber Users Guide No. 12 awaits your request. Send for it.

Lumber Camp Ranges and Heaters

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

Write for our catalogue.

KEEP THE WORK GOING

Nothing is more important in logging than the prompt and certain movement of cars.

Delays affect the whole work. To avoid delays, locomotives must be reliable and always ready for service.

Our standard logging locomotives are built to insure reliability and constant service. Only tested materials are used in their construction. All wearing parts are made to templates and gauges. Interchangeability of like parts is guaranteed, and long delays waiting for duplicate parts avoided.

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**A Reliable Engine in the Woods**

In logging operations the scene of activity is often many miles from repair facilities so the wise lumberman will appreciate the importance of a reliable locomotive. Our locomotives are built with this fact in view. They are sturdily and simply constructed and will give continual service all the year round.

Logging and industrial locomotives are a specialty with us. We are prepared to construct any special types or submit specifications.

If you are in the market we will be pleased to hear from you.

Canadian Locomotive Company, Limited, Kingston, Ont.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, 1½ cents each.

Railway ties, nine feet long, 1¾ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent, on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

BUFFALO, N. Y.**

Timber Concessions in the Province of Quebec

Notice is given by the government of the Province of Quebec that, on the 11th of August and on the 20th of October, 1914, permits to cut timber on over 8,000 square miles of Crown Lands will be offered at public auction.

The territory to be disposed of comprises some 1,200 square miles in the basins of rivers Ottawa, Harricana and Bell, in the Abitibi region; 6,000 square miles in the Lake St. John northern region; 350 square miles in the Lake St. John East agency; 242 square miles in the Matapedia division.

On the first date above mentioned, permits will be offered at ordinary conditions on some 3,000 square miles.

The timber grants advertised for the 20th of October, comprising the basins of three large rivers in the Lake St. John region with considerable water powers, will be subject to the obligation of manufacturing the wood into pulp or paper within the Province of Quebec.

For particulars, please apply to the Department of Lands and Forests, Quebec, Canada.

Elz. Miville Dechene,

Deputy Minister of Lands & Forests.

Quebec, 11th April, 1914.

Waterous Engines

Continuous Service with Little Attention

Make your choice of an Engine for the Sawmill the Waterous Side Crank Sawmill Engine. It is built for the work. With strength and simplicity it combines the ability to be on the job all the time

There is nothing to get out of order. Parts are few, are sturdily built of the best of materials, and are easily gotten at for oiling and overhauling : : : : :

Give it an occasional wipe-down and a dose of oil on the wearing surfaces, and the engine will run from whistle to whistle without a hitch : : : : :

We build both Single and Twin Engines of this type in sizes up to 600 H.P. If you want an engine that will give you absolutely reliable service under all sorts of conditions ask us for Catalogue and Prices : :

*Remember we furnish Power Plants complete in all sizes, and have made a specialty of Sawmill installations : : : : :
Any Information we can give you is yours on request : : :*

"FROST KING" METAL

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

\$5,000,000.00

worth of mixed metal
sold annually.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 18-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

Save All The Hand Fitting!

Use Shimer Cutter Heads in which the Bits are simply filed or ground to sharpen and set to a gauge—no more trouble than filing a saw. They eliminate hand fitting and make the men and machines so efficient that a quality product can be turned out in paying quantities. They save time, save labor, save material—do away with the fitting, trying and other annoyances, and cut so easily and clean that power is also saved. They maintain uniform patterns because the shape of the pattern is turned into the long-life Circular Bits and never changes when the Bits are sharpened.

Shimer Cutter Heads are provided with the latest developments in the art of reducing friction and wear on the knives. The Bits are bolted to Conical Duplex Bit Seats to secure perfect point and edge clearance. Working in pairs and in upper and lower series upon the Head, they divide the cut in a shearing manner, lessening the tendency to pull out knots and splinters on hard and cross-grained lumber.

The edge outline of the Bit only comes in contact with the lumber and shapes it accurately. As the cutters are filed or ground to shape on the inside of the circle the shape never changes. All that portion of the cutting edge is brought into service as the cutter is sharpened and brought around upon its holding bolt to again fit the gauge.

There's a Shimer Cutter Head for every kind of matching and moulding service. If you will state your conditions and give us measurements of your machine we will send you the proper tools on free trial. Write us today.

The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628
FOR THE HIGH SPEED MATCHER

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new chisel point given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, \$72.46 the set complete.

28' Band Sawing Machine

Every Woodworker is Interested in a Band Saw, But there are few Band Saws that interest every Woodworker. Here, however, is one that will, and this is why:

It bears the name "Defiance" which is a guarantee that it is a well built and accurately fitted machine, up-to-date in every particular. The wheels are 28-in. in diameter by 1½-in. face, covered with pure rubber bands; they are given a true running balance and are supported upon ground steel spindles running in long self-lubricating bronze bearings. The lower wheel is of the solid web type covered with metal shield, while the upper wheel is covered with a screen shield or safety guard. The table is 24-in. x 28-in. and will tilt to an angle of 45 degrees; an ingenious spring tension device automatically regulates the tension on the saw blade and non-friction guides are used both above and below the table. This machine will take stock 12-in. thick and under and is furnished complete with brazing tongs and vise.

The Defiance Machine Works, Defiance, Ohio, U. S. A.

Solid and Inserted Tooth Circular Saws

We make a specialty of these lines

**We remake old Solid Tooth Saws
into new Inserted Tooth Saws**

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 10

The Traveller's Strongest Argument

There is no hard and fast rule for regulating the number of times when a wholesaler or manufacturer should call upon his customers. If there were any such rule, it would probably be broken more often than any other rule that we know of. Nevertheless, one of the most important matters connected with the successful management of a wholesaling or manufacturing business has to do with this question. The most successful man in the business of selling lumber is one who combines the ability to make himself welcome and the ability to regulate his calls in such a way as not to miss any important chance of securing an order.

There is no doubt that the consuming trade have, many a time, a good excuse for wishing that fewer travellers would call upon them, or that those who do call would do so less frequently. Everyone who has had experience as a lumber traveller knows how frequently he has found a line of travellers waiting for an interview with a customer from whom he hoped to take an order. Every consumer of any importance knows how frequently he has devoted a large part of a very busy day to interviews with salesmen, when he could have employed his time much more profitably. And every traveller, no matter how successful he may be, knows, to his sorrow, of a few occasions at least when he has just missed a juicy order which he might have had if he had been on the spot a little sooner. Some people will say that this is simply a matter of the survival of the fittest and that it makes little difference, one way or the other, because in the end the business is transacted and the stocks are moved, and the best man with the best stock gets the best results.

But is this really the case? Is it not often the fact that the man who gets the order does so by chance? It is his lucky day perhaps; perhaps also it is the customer's unlucky day, if he only knew it. He might get the stock or even better stock at a price which would be more profitable to him. Then again, the consumer cannot help feel-

ing many a time that there should be some way of regulating the visits of the salesmen so as not to involve the consumption of so much valuable time in interviews which cannot result in business. And the salesman; what about his side of the case? Does he not feel many a time, that if he could only get out of the calls which result in nothing, he could show far better results?

Nowadays, when business conditions are slack, this question comes up for more discussion than it did a year and a half ago. Then, a traveller did not mind a few hours spent upon a profitless visit, because he felt pretty certain that he would soon run down some exceptionally good orders which would more than bring up his average. But to-day, the shoe pinches badly, and the profits of the firm grow continually smaller, in proportion to the number of calls which one pays upon firms where no business is to be had. It is just under conditions of this nature that the real lumber salesman is borne, and the mere order taker is shown up.

To-day, when orders are few and salesmen are many, the man who keeps incessantly before his customer the fact that real value is what he should consider, not simply price, and who shows the customer that he can give him such value, both in stock and in service, is the man who is most likely to win. The "value" argument is one which will carry more weight to-day than any other. Large and important consumers know very distinctly just what their trade requires and are in a position to appreciate the importance of getting, for their money, a class of stock which will work up most advantageously. It happens often, that the salesman is told his prices are too high, and that, by taking the trouble to explain the quality of his stock, he can show the consumer that in reality this price is lower than the price of the stock which the consumer has been buying for some time; stock which probably involved so large a percentage of waste as to make it actually more expensive than the high-priced stock of high quality.

These questions of value and price are rather everyday matters to experienced salesmen and to the ordinary buying consumer. We would not discuss them here, were it not for the fact that they involve questions which never seem to be settled. They are disposed of perhaps for a time or for a particular consumer, but they crop up again in a new locality or a little later on, when new business conditions arise. It is strange how often a consumer or a salesman settles all these questions in his own mind without putting his conclusions into practice. There is something about the coming together of a salesman and a customer which often upsets all theories. The moment they commence to discuss a question of buying or selling, some strong currents of thought seem to come into play, which obliterate, for the time being, all those well worked out theories to which they have each devoted so much time. In good times, lumber selling, or buying, is much more a matter of simple business contract than it is when times are dull. Then it becomes a psychological study—a scientific exercise of all the skill acquired from long experience.

Every year sees changes in the methods of doing business. There was a time, not so very long ago, when much of the lumber selling business was conducted upon a plan which meant large sales at regular, but lengthy intervals. The last few years have seen this changed into a system of frequent purchases of smaller quantities, involving much more frequent calls upon customers. A few years ago, one heard only occasionally of the "hand-to-mouth" policy of the consumer. To-day, it seems as though every consumer of lumber was doing business upon this basis only. The amount of personal canvassing which the trade requires to-day, seems out of all proportion to that which existed a few years ago. We hear it said to-day, however, as we did then, that there are too many salesmen and that the trade is "over-solicited." Perhaps, in a few years time, when competition has become still keener and business more microscopic, we will look back upon the present as a time when things were more leisurely, and when the trade was not solicited too frequently.

In the light of the past, and with the experience of to-day to guide, it seems as though "over-solicitation" is not the cause, but simply one of the results of some more deeply seated evil. If we go far enough

back we will come to something which is much more like a cause than an effect; namely, "lack of salesmanship" in the widest sense of the term. "Lack of salesmanship" does not simply mean inability to approach a customer in such a way as to get upon his good side and take his signature to an order. It means really something far more vital, in connection with the successful work of a salesman. It means in the first place lack of appreciation of the other man's point of view, and in the second place lack of appreciation of one's own opportunities. Every man who takes an order for stock in regard to which there exists a possibility that the consumer will be disappointed, or will have reason to feel that he might have done better, is falling short of his possibilities as a salesman. The first consideration in selling lumber should be, to give the customer such value that, upon the next occasion when he requires stock, he will be prejudiced in favor of the firm

from whom he has already purchased. There can be no two ways about this. Its force is greater in dull times than in good. It applies to-day more than it ever did before.

There may be too many men upon the road to-day offering lumber for sale, but that is not the trouble. The real trouble is that there are many men upon the road seeking to take orders instead of seeking to give value. The root of the evil is right here. The number of times that a customer should be visited is an important matter, but it has nothing like the same importance as the giving of value. In fact, giving value will go a long way toward solving the problem of how often a customer should be called upon. The salesman who gives value will find in many cases that it is his strongest argument, and upon subsequent occasions when there is business to be had, it will seek him, instead of it being necessary for him to seek the business.

Dry Rot Causes Expensive Lawsuit

A most interesting and important judgment has been given in Montreal by Mr. Justice Panneton in the case of the Canadian Spool and Cotton Company against Peter Lyall and Sons and Messrs. Brown and Vallance, architects. The question at issue was one involving the use of timbers in a mill building. After the building had been in use for about a year, dry rot commenced to set in in some of the timbers and the owners replaced them with steel. Then they brought suit against the contractors and the architects. The result is a judgment in their favor against the contractors for \$71,120.85, while the architects are jointly and severally condemned with the contractors in the sum of \$67,022.12. According to the reports of the case which are now available, the contractors, according to the specifications, undertook to supply "all timber, Georgia pine, long leaf straight grain and free from knots." That they did not do so except in the case of very small quantities was admitted and proved. The reason given was that it was found impossible to get the required quantities otherwise than at prohibitive prices, as it would have to be picked at different mills. Instead, they had used a good merchantable grade of wood. Mr. Justice Panneton, commenting on this point, remarked that contractors had their own ideas about the fulfilling of a contract, but in the present instance there was a direct breach of contract, the consequences of which the contractors did not anticipate, relying, as they did, upon what in practice was considered as good timber at least for solidity and some other qualities. Unfortunately for them, it did not turn out to have the same resisting ability to the dry rot germs as that required in the specifications. The result was that after they had taken possession and had installed their machinery, plaintiffs had been forced completely to renew and replace the beams throughout the structure with steel. It was expense incurred in this operation

that went to make up the claim which, as presented, totalled \$91,000.

His Lordship in giving judgment said: "Defendants Brown and Vallance merely deny the main facts of plaintiffs' declaration and say that dry rot was due to causes over which they had no control and for which they are not responsible. But they further urge and offer for their defense that plaintiffs allege that the building was never finally accepted by them, and that fact being alleged they say that under the Civil Code, plaintiffs have no right of action, as the building was the property of defendants Lyall and Sons.

"That allegation of plaintiffs' declaration is denied by both defendants in their plea. But whether finally accepted or not it does not alter the situation. Defendants Lyall and Sons have allowed plaintiffs to take possession of the building to start their operations therein and the dry rot was discovered only after plaintiffs have been in full possession of the building for nearly one year and defendants Lyall and Sons did not pretend to have anything more to do with the building, and so far as they were concerned the delivery was complete. What plaintiffs did in undertaking to replace wood by steel was an acceptance of the building which would preclude them from finding fault with it for anything for which defendants Lyall and Sons would be responsible otherwise than under article 1688 of the Code. Ten years' liability exists even after delivery and acceptance has been had. When plaintiffs' plant and machinery were all in the building and the works in operation, plaintiffs had to go to work at once to do what was necessary to prevent further damage which would result from allowing the decayed wood to go to pieces and carry down the whole machinery, involving perhaps the loss of life."

It is announced that the case will be forthwith taken to appeal.

The Proper Marketing of Lumber

Whenever any discussion arises in regard to advertising lumber, the editorial department of a lumber trade journal naturally feels inclined to withdraw and leave the discussion entirely in the hands of expert advertising men. The subject is one which, in a large measure, lies definitely outside the field of lumber manufacturing. When it comes to a question of lumber selling however, the situation immediately changes and, inasmuch as the editorial efforts of a lumber trade journal are devoted to publishing information which will assist all who are engaged in the business of producing and distributing lumber, an occasional reference to the subject of advertising is permissible.

These thoughts are suggested by a letter which was recently received from Jas. D. Lacey & Company, Timberland Factors of Chicago; in the course of which some exceptionally forcible points were brought out in connection with the subject of advertising. The firm in question have naturally found advertising in trade journals one of the most direct methods of appealing to their customers and prospective customers, who are peculiarly of the lumber manufacturing class. One of their advertisements, which is well known to most

readers of trade journals, bore the heading "Timber is Cheaper To-day than it was Three Decades Ago."

The strength of this heading attracted the notice of the editor of "Printers' Ink," a journal devoted particularly to discussion of the advertising business. The editor of "Printer's Ink" wrote to Jas. D. Lacey & Company and asked them a number of questions, the chief one being as to the probability of lumber manufacturers becoming extensive advertisers to the consumer. The interesting features of the letter above referred to are contained in the reply sent to this question.

After giving an interesting resume of the lumber manufacturing industry from its earliest days, when the finest white pine trees only produced two or three logs, and any trees with visible defects were discarded, a contrast was drawn with present day methods involving so great an increase in the quantity of lumber secured from an acre of land. "The demand for lumber was constantly broadening," says the letter, "until about ten years ago. At that time substitute materials began to come on the market. A place was made for them by persistent advertising and aggressive sales methods. Lumber manufac-

turers regarded the situation tolerantly. They conceded the possibility of advertising patent roofing, composition shingles, cement, hollow tile, concrete blocks, and all manner of substitutes, and by means of advertising to promote the use of such materials, but their product was something that 'could not be advertised.'

"Furthermore, they did not know and do not know, how to use advertising, or just what the results of advertising should be. They have figured that \$3,000 spent for advertising produces intangible results, whereas \$3,000 spent for a salesman produces tangible orders. They heretofore have sought the salesman instead of the advertising.

"Substitute materials have been used to build dams across outlets for lumber. Instead of new uses opening up and affording new outlets, some of the old ones are being closed up and the result is congestion in distributing markets and original sources of supply.

"It is easy to advertise lumber, because we have proof of its value on every hand. There is no great initial expense of introduction involved, as in the case of new materials. A faint perception of that fact has penetrated the mental orbit of lumbermen and is being given more and more recognition as the days go by.

"Lumbermen have a very keen perception of the value of their product. Unfortunately they have credited the building and home-owning population with similar information. Thirty years ago, when we lived close to the woods and other elementary things, their view was correct, but the forests have been cut away and our surround-

ings largely are man-made. Lumbermen who started in business twenty to thirty years ago are slow to acknowledge the change.

"This new generation 'which knows not Joseph,' must be educated regarding lumber values, but first it is necessary to educate the lumber-manufacturer to the necessity of educating the consumer. The initial work is progressing as rapidly as could be expected."

The letter then outlines the various lumber advertising campaigns which have been inaugurated in the United States, including those of the Louisiana Red Cypress Manufacturers, the Southern Arkansas Soft Pine Manufacturers and the Northern Hemlock and Hardwood Manufacturers. It also notes that the West Coast Lumber Manufacturers decided to advertise recently and that the Yellow Pine Manufacturers had been doing so for some years.

Continuing the letter says: "Lumber advertising is essential to the proper marketing of lumber. Every builder should be advised regarding wood values and wood advantages. Seemingly the public has swallowed, if it has not digested, all the misinformation regarding the worth of substitutes."

In conclusion the letter says:—"In our estimation all that is needed to make lumber advertising profitable is the proper understanding of advertising by the lumbermen, an appreciation of the fact that advertising is one phase of sales effort, not a panacea in itself, and the further admission by the lumberman that the man who pays the bills is entitled to complete information regarding the materials he uses and is a person of consequence, whose favor should be sought."

Retailers' Customers—Old and New

New customers or old ones should look alike to the retail lumber dealer. The best standard of treatment for an old customer is that which a dealer gives to a new one whom he hopes will become regular and profitable. Old customers, even though the amount of their trade may be comparatively small, are generally a greater asset to the retailer than a prospective customer for a fairly large trade. The old customer is a satisfied one and his regular trade is a permanent asset so long, as he is given satisfaction. Moreover his satisfaction is an active advertisement for the dealer. These are simple facts in connection with the management of the lumber business, but unfortunately they are not always recognized as fully as they should be. There should be no difference whatever in the treatment of customers, whether they are old or new. The standard of the retailer should be to satisfy every customer, once he has satisfied himself of the customer's ability to pay.

Seeking for new customers is often allowed to interfere with the service given to old ones, to the direct loss of the dealer. If one cannot look after both ends of the business satisfactorily, he is trying to cover too much ground or else he needs more assistance in his business. To keep old customers and make new ones at the same time, requires careful and systematic study. In looking for new customers many methods are available. The most important however, is the exercise of eternal vigilance. Advertising, sending out circular letters, and making personal canvass are the chief methods. If they are not attended to systematically, the number of new customers will not balance the number of old ones dropping off on account of competition or on account of families moving away from the district. No opportunity should be neglected of working up new trade by the method referred to. If the staff is not large enough to do justice to this work, it should be enlarged so that proper attention may be given to both branches of the business.

"Service" is a word which has taken on a very definite meaning in business of late years. It signifies those activities in connection with a business which render it capable of furnishing customers promptly with exactly the goods they require. Its duty is to keep customers who have been secured and to encourage them to make further purchases. Its work commences once the firm has got into touch with a prospective customer. If successful, it persuades the customer that he will do well to purchase, and when he has purchased it sees that the goods are delivered in such a manner and of such a quality as to make him feel pleased with the transaction.

A service department may be considered by some as unproductive of value. In a restricted sense of the word this may be true, but, as a profit producer, the importance of "service" is great. The difference between an aggressive, expanding business, and one which is practically stationary, may be measured very exactly by the difference between the efficiency of their services. If a retail lumber company is expanding at about the same rate as the community, its service is probably good, but there are many firms whose business expands even more rapidly than the community itself, impossible as this may at first appear. Such a business will be found to be following out the most advanced and effective methods of giving service. Its conception of service does not stop with furnishing simply the goods and the service which it might be expected to furnish, and supplying the district with sufficient for its ordinary growth. It involves also anticipating the requirements of the community in its own lines and in lines relating to lumber; so that a customer who is building, may be supplied with other building materials which he might have to seek in several different stores or possibly in some other town. It involves also persistent and effective preaching of the gospel of expansion; encouraging the community to grow; instilling into it, in short, the same progressiveness that characterizes the company itself.

To put the matter briefly, the retail lumber business depends upon all these departments exerting their utmost activity in getting new customers, satisfying all customers, and encouraging trade. These are the positive trade creating factors and they must be closely allied with similar standards in connection with watching credits, studying stocks, and systemizing management.

None of these factors can be neglected without affecting all the others adversely. Actual success depends upon all, and continued success depends upon their being properly balanced in proportion to the extent of the business and its possibilities of growth.

A report from Vancouver states that the Board of Works recently refused to consider tenders for lumber ranging in price from \$11 to \$14.50 per thousand feet, because the tenders were from firms which do not use white labor exclusively. A resolution was recently passed by the City Council to the effect that it should endeavor to encourage firms which do not employ Orientals.

A Vancouver lumberman has estimated that one ton of refuse goes to the burners for every thousand feet of lumber cut.

Driving Operations Helped by Rainfall

Ontario Manufacturers Report Better Conditions During Past Fortnight—Water Lower Than Usual Throughout the North

The driving conditions in northern Ontario improved considerably during the past fortnight as the result of a fair amount of rainfall. Results in connection with drives are indicated by the following reports which have recently been received.

Grant & Kennedy, New Liskeard, Ont., May 5th: This is not a good year to drive, as the water is low and the weather has been cold until now, while the snow got away little by little.

Graves, Bigwood & Company, Byng Inlet, Ont., May 7th: Our drives are all progressing favorably, and the rain we had about ten days ago filled all the creeks and streams upon which we have logs.

The Knight Brothers Company, Limited, Burks Falls, Ont., May 5th: We expect to have sufficient water to get down all our logs. Fortunately all our drives are short this year and we do not anticipate any trouble.

Chew Bros., Midland, Ont., May 5th: Our lumbering operations this season have been conducted on an island, consequently there will be no driving in connection with that. It is just a matter of getting the various lots together and making up a raft.

The Clyde Forks Lumber Company, Clyde Forks, Ont., May 6th: We expect to get all our drives down now. The main body was about ten miles from our mill and, although things did not look very favorable at first, the prospects at present are favorable.

A. Mitchell, Powassan, Ont., May 5th: I do not drive any logs myself. In regard to river driving in this district the last two or three weeks have been very good as the water has been very high, but it is going down fast now, and unless we get some heavy rains it will dry up very quickly.

Geo. Neibergall & Son, Parry Sound, Ont., May 8th: Log driving conditions here are alright. We expect our drive to come out in another week and a large drive has come out already. The water, however, is getting low, and there may be a shortage at the end of the season, unless heavy rain comes.

Keewatin Lumber Company, Limited, Keewatin, Ont., May 7th: Driving conditions here are fully as good as they were last year. All of our driving is done on lakes, and the stage of water in these lakes is about normal. We do not think we will have any difficulty in getting our logs to our mills this year.

Wilson, Campbell & Campbell, Massey, Ont., May 5th: We do not anticipate any trouble with the taking out of our drives this season. In fact, we expect to be out in a very short while with about a million and a half of hemlock, pine and spruce. The recent heavy rains in this district will assist materially in getting out of the timber.

The Trout Creek Lumber Company, Trout Creek, May 9th: We have all our drive out, but in the neighborhood we know of a drive which, we think, will be stuck, unless we have a lot of rain. As there is not much driving in our localities, we do not know much about the drives, but think there will be shortage of water unless we get wet weather.

An operator in the Bruce Peninsula, Ont., under date of May 2nd, reports a very difficult time with his drives. We were first held back, he says, by ice staying on the lake and leaving no room to run logs out. Since then, water has been low. We had no rain of any kind till April 28th, and then not enough to do any good. Two days more will complete the drive, but this is two weeks longer than it should have been. Ninety per cent. of our present stock is sold at last year's prices.

George Tennant, Bracebridge, Ont., May 6th: There is no doubt about the existence of a shortage of water in this locality this season, but have no information as to whether any of the lumbermen are going to have their drives hung up or not. As for my own I will have no trouble in getting it to the mill, as I have only a short distance and a good stream that can be driven any time through the summer.

Jacob Kaufman, Berlin, Ont., May 4th: The driving of logs at our mill is nearly completed. There apparently has been sufficient water at this point. We have 1,750,000 feet of logs this year, principally hemlock. The cost this year is nearly \$2.00 in advance of last year and the wages are about the same.

Holt Timber Company, Limited, Chicago, May 8th: Our drives on the Magnetawan River from Deer Lake to Byng Inlet are progressing very satisfactorily indeed and are up to last year in point of time.

This is largely due to the fact that we had sufficient water in storage to supply our needs, but we made extra efforts in order to obtain it, fearing the conditions which have since developed. There is practically no reserve of water in the swamps or ponds unless artificially impounded. There is still time for the rains to help out the drives but our understanding of it is that throughout the Ontario woods the water supply is very low, and that reserves are also very low, and the likelihood is that driving will be seriously interfered with.

Estate of Alfred McDonald, Peterborough, Ont., May 8th: We have two large saw log drives, one coming out of Nogies Creek and the other out of Squaw River, into Pigeon Lake below Bobcaygeon. Swamp Lake is the head of Nogies Creek and the water was five feet lower when we commenced to drive than at the same time last year. It will require a lot of rain to get out of this creek. Otter Lake is the head of Squaw River and it had a full head when starting, but no rain since to keep it up. We have quite a number of storage dams on this stream and expect to get out by employing double the usual number of men to keep the logs running clear with the one flushing of water from the supply dam.

Unless we have plenty of rain soon we would not be surprised to hear of many logs being hung up in this locality.

The Pearce Company, Limited, Marmora, Ont., May 7th: Driving conditions in this district have not been at all good. Considerable difficulty has been encountered owing to the unusually low water, which is from three to four feet lower than usual at this season of the year. We are confident, however, that one drive at least will arrive safely and we hope also to succeed in bringing the other through, although it is heavy work and will be longer coming down than has been the case in a good many years. We do not know of any other parties who will have any drives on these waters, viz., Crow River, Deer River and Beaver Creek. We understand also that firms who have considerable bodies of logs further west in the Trent River District are practically tied up, and unless we have heavy rains during the next two or three weeks it is very doubtful whether they will succeed in getting their stuff out.

Our cut of pine will be about the same as usual, but we will not have as much hemlock. As we were practically sold out of both these stocks last fall, we will require considerable of the new cut to stock up for our local trade. While the local market is fair it is not by any means as brisk as it was at this time last year.

As the costs of logging operations and driving are fully as heavy as a year ago, in spite of the favorable weather conditions, it will be very unfortunate if price cutting is resorted to, and we doubt very much if it will, do much good towards increasing sales. Apparently, American competition is pretty keen. They are quoting very low figures in order to get the business. We might say further that the present season has been one of the most puzzling that the writer has experienced in many years, indications being so conflicting.

The Davison Lumber Company, of Bridgewater, N.S., estimates its cut of lumber during the winter at 40,000,000 feet.

James Robinson estimates that the cut of lumber on the Miramichi River in New Brunswick last winter amounted to about 50,000,000 feet. He says it is becoming more difficult to get men to go to the woods to cut lumber by contract, owing to the scarcity of labor and higher wages in other lines of industry.

Will Help Lumber Trade With China and Japan.

In a report to the Dominion Trade and Commerce Department Mr. Gordon Johnson, the new Canadian Trade Commissioner to China and Japan expresses the view that the opening of the Panama Canal will be of great advantage in developing the Canadian lumber, pulp and paper trade with the Far East. "While Eastern Canada," he states, "is handicapped by its great distance by water from the Orient, the opening of the Panama Canal will put Montreal at least in as favorable a position in regard to distance as European countries, so that not only British Columbia, but Ontario, Quebec and the East should be in a position to take a share in it."

The forests of Argentina are said to contain enormous reserves of quebracho, a tree of large size producing a very hard wood containing from 16 to 26 per cent. of tannin. In 1911, Argentina exported 68,431 tons of tannin extract, besides 35,793 railway ties made from this wood and 438,216 tons of the timber.

The Reader's Viewpoint on Trade Topics

Ontario Hemlock Manufacturers' Ideas Regarding Wisconsin and Michigan Stocks—A Few Questions About the Panama Matter

The importation of Wisconsin and Michigan hemlock into Ontario has been increasing of late, and the Canada Lumberman recently received a letter from a large consumer of this lumber, which brought up the question of how it can be imported into this province and compete successfully with the hemlock produced by Ontario manufacturers. The consumer in question uses a large amount of hemlock, and in his letter said that he could buy the Wisconsin hemlock much cheaper and that it was a better class of lumber. He had taken as much as 5,000 feet absolutely clear out of one carload of 1 x 10-in. hemlock, and he concluded by saying that it was "only a matter of a short time before the Ontario hemlock manufacturers would have to get in line and put up a proper grade."

The hemlock manufacturers of Ontario recently drew up regular grading rules and formed themselves into an informal sort of an association. While they are not organized in any way, they hold regular meetings and exchange information as to the output of stocks, and the general state of trade. At all their recent meetings it has been the opinion of those present that their grading rules have been the means of improving trade conditions greatly, and that during the last six months or more, prices of hemlock have been so low in comparison with the cost of production that, if they were to go any lower the manufacturers would have to operate at a loss or go out of business. These views and those expressed by the consumer of hemlock referred to above are so clearly opposed to one another that the Canada Lumberman, feeling that something in the form of an expression of views from the hemlock men would help to clear the air, sent a copy of the remarks of the consumer to a number of hemlock manufacturers in Ontario. In reply we have received the following letters:—

Has No Trouble Selling Canadian Hemlock Grades

Editor Canada Lumberman: Owen Sound, May 4th.

We thank you for having called our attention to remarks of an "Important Ontario Consumer of Hemlock."

Our experience is that Michigan and Wisconsin hemlock is invariably sold graded as what they call "merchantable" and includes up to thirty per cent. of number two quality.

We had one of the largest manufacturers in Michigan here the other day and he was asking \$18.00 per m. for their hemlock of this grade, in cargo lots, running from 2 x 4-in. to 2 x 12-in. and the buyer would have to take this stock as it runs, mixed widths and lengths.

We are selling No. 1 quality, assorted widths and lengths, giving the buyer the number of pieces of each size wanted, at \$20.00 per m. f.o.b. car here and on this basis, we have no trouble in selling all we can manufacture.

The expense of logging and manufacturing has increased so much that we could not successfully continue if we had to sell at a lower price.

There are a few wholesalers and scalpers in Ontario who are continually using arguments of this kind in order to force the manufacturers to lower their prices. These wholesalers and scalpers do not increase the consumption of lumber and in our opinion the trade could get along very nicely without them.—John Harrison & Sons Company, Limited.

Thinks "Ontario Consumer" Should be a Wholesaler

Editor Canada Lumberman: Huntsville, Ont., May 5th.

We are inclined to think that the Ontario consumer who has had such wonderful luck purchasing Wisconsin hemlock should go into the wholesale business, or better still come north and show some of the northern mill men how to manufacture hemlock and sell it with a profit, at \$3.00 to \$5.00 per m. less than last year's wholesale prices. We are inclined to think this consumer was in very badly last year, or he has fallen into a particularly soft spot for 1914. We tried to pick all the clear 1 x 8-in. and wider out of a million and a half feet of hemlock cut in 1909 and only put up about 6 m. feet. This 6 m. feet was not absolutely clear. We gave up in disgust trying to get clear hemlock.

We might also say that during the present day we have been called up by responsible Toronto lumbermen who bought 1 x 6-in. and 1 x 8-in., also 2 x 4-in. and wider 10 to 16 ft. hemlock, at a price equal to the best price we received during 1913. This stock was fresh from the saw and the dealer who bought it has as good credit as any firm in the city.

We do not wish to appear in a discussion of the present prices of hemlock but are satisfied that before the snow falls in 1914-15 it will

be difficult to obtain sufficient hemlock to meet the needs of Ontario builders.—Northern Manufacturer.

The Panama Question—What is the Answer?

Editor Canada Lumberman: Toronto, May 5th.

Your editorial on "B. C. Fir and the Panama Canal" raises many questions that will be settled only by time and actual experience.

It seems to be assumed off hand that, because someone has predicted that lumber will be carried by water from the Pacific Coast to Atlantic ports for 20c per 100 lbs., therefore there will be a tremendous decline in values in the east; that the eastern markets will be flooded with cargoes of Pacific Coast lumber and that receiving and trans-shipping yards in Eastern Canada will handle the business which is now done direct by rail from the British Columbia mills.

It is easier to ask questions than to answer them in the absence of definite information or experimental knowledge. But there are a few questions that may be raised at the present time.

Is it likely that Pacific Coast manufacturers will give to the eastern dealers the full benefit of any reduction in freight rates that may follow the opening of the Panama Canal?

Why should it be assumed that Pacific Coast lumber on a freight rate of 20c to an Atlantic seaport will be a ruinous competition with yellow pine on a relatively lower rate by rail from the south to northern points?

Is it likely that the great transcontinental roads in Canada and the United States will hold up a freight rate of 67c per 100 lbs. and let the Panama Canal route take away all the Pacific Coast business?

Are railway freight managers built that way?

Freight rates are based on many factors, such as competition, time, occupied in transit, return cargoes, etc.

Tramp steamers will probably be the first to experiment on rates. What return freight can a steamer obtain from the Atlantic back to the Pacific Coast? One-way traffic is not a paying proposition.

Experience alone will demonstrate what rates will be profitable for the carriers, and until the Panama Canal route has been tried out, we are only making guesses.

What share of the expected increase in trade will the British Columbia manufacturers obtain? Oregon, Washington and California sawmillers have equal advantages in this market.

Is it a feasible business proposition to assume that a receiving and trans-shipping yard in Eastern Canada could be made to pay in competition with the carload trade direct from the British Columbia mills to the retailer in Ontario?

These are a few of the questions that time and experience only can settle.—John Donogh.

Will Cross the Bridge When They Come to it

Editor Canada Lumberman: Toronto, April 30th.

The effect of the Panama Canal upon the lumber trade is something which we have been thinking about for quite a long while, and upon which we have had correspondence with some big firms in the south. Their answers at that time were, "that they would cross the bridge when they came to it."

It is a big question and in the course of time prices as between southern pine and B. C. fir will level themselves up like so much water.

We have been given to understand that the price of the British Columbia timbers for Toronto harbor was about \$30.00 per M., which would make the contract \$720,000. If you are taking the price which has likely been paid for the timber at the coast your figures (\$250,000) would not be much out of the way.

We find the freight on shingles is costing us from \$1.02 to \$1.05 per M., occasionally slightly more.

One of the things which must not be lost sight of is that a great deal of the business as between eastern points and B. C. is for hurry-up orders, 1, 2, 3, 4, or 5 cars perhaps, and such orders could not very well be filled via the Panama Canal. It is true that there are firms who propose having facilities on the eastern coast for filling such bills from stock but they could carry twenty million feet, and be asked every day for what they have not got, and such stocks could not be carried except at very considerable cost.

Hamilton & Willis, incorporated as the Vancouver Cedar Lumber Company, have taken over the saw mill and plant of the South Vancouver Lumber Company, at Eburne, B.C., which was owned and operated by W. R. Dick. Mr. Hamilton was manager of the Canadian Cedar Lumber Company, Vancouver, while Mr. Willis was sales manager of the Hastings Shingle Company, Vancouver.

Has Canadian Pine Met Its Equal ?

Siberian Yellow Pine Manufacturers Securing Recognition in United Kingdom
—Will Probably Invade China and Australia Also

Several articles have been published in the Canada Lumberman during the past year, dealing with the trade in Siberian yellow pine, with the United Kingdom. These articles drew attention particularly to the fact that this Siberian product is generally acknowledged to be the equal of Canadian white pine, and that it is being accepted in the United Kingdom as a perfectly satisfactory substitute. An important illustrated article dealing with this timber appears in the annual special issue of "Timber" of London, England, which was published on March 31st. The references in the article to "Quebec yellow pine," refer, of course, to the well-known Canadian white pine, which is generally known in the United Kingdom as "yellow pine." The "standard" referred to is the St. Petersburg standard hundred of 1980 superficial feet.

To trace the history of this comparatively new wood, the article says, will possibly be of interest to a large number of our readers, especially those who have for many years handled Quebec yellow pine, and who, by reason of the consistent appreciation in value of that most excellent wood, have found, as time has gone on, that not only the demand, but also the margin of profit, has gradually dwindled, until it has become a question whether it is worth while putting the Canadian wood into stock. In fact, large holders of pine have in recent years been compelled to consider the advisability of turning their attention to other branches of the timber trade, because of the more and more restricted demand for an article which had been with them the corner stone of their operations. It is possible that, with the advent of the substitute which is the subject of this article, the decline in the use of pines, which has made itself so unpleasantly felt, will be arrested, and, by reason of its efficiency as a substitute for the Canadian article, and the considerable advantage offered in price, a revival and broadening of the consumption may be inaugurated. Granting that Canadian and Siberian pine are of equal merit, there is one very substantial reason for merchants regarding the latter sympathetically, and that is, the larger margin of profit which it bears.

Prices of Siberian Pine

We have seen a price list of one of the great importing firms of this city, according to which an abundant inducement is offered to merchants and consumers. We see that 1 in. to 2 in. thick, x 7 in. and up wide, averaging 13/14 in., can be purchased at £29 per St. Petersburg standard hundred, as and where lying in the docks. Other prices are as follows:—

2½ x 7 in. and up, av. 13/14 in.	£30
3 in. and 4 x 7 in. to 10 in.	£31
3 in. and 4 x 11 in.	£35
3 in. and 4 x 12 in. and up	£36

While, for a selected specification of siding, as, for example, 2 x 12 in. and up, £33 10s. is asked. Such prices make Quebec stocks look very dear, and, at the same time, show that other pines, such as the Californian variety, cannot hope to attract much attention.

It is an undeniable fact that each succeeding shipment has shown in some feature or other distinct improvement on the previous one. The grading and manufacture has consistently improved all the time, but what is much more important, the recent shipment imported in Liverpool and London, ex the "Andree Rickmers," for example, shows that closer attention has been paid to the regularity of character. What, after all, does it really matter, from any practical man's point of view, if a small percentage of pieces in a parcel is not quite uniformly sawn or contains minor defects. These are trivial difficulties which are easily adjusted, or even overlooked, by merchants, if the nature throughout compares favorably with the sister wood.

After a brief reference to the botanical identity of Siberian yellow pine, the article continues:—It would be claiming too much were Quebec shippers to assert that even the best of their productions were free from a substantial percentage of pieces which might be termed hard-grained, and this being a fact generally admitted leads one to the belief that Vladivostock shippers will not set themselves such a stupendous task to equal Canadian shipments as it appears to be on the face of it.

An outline of the development of the import of Siberian yellow pine into the United Kingdom is then given, after which the article says:—Generous opinions are expressed by the leading pine men of the United Kingdom, but it should not be overlooked that mixed shipments such as have been sent over in whole steamer loads gives the chance for adverse criticism. It is only fair to say that the atti-

tude of Quebec shippers vis-a-vis Siberian yellow pine is by no means unfriendly. On the contrary, a number of them have frankly admitted that the bulk of all shipments of planks, etc., so far made to this country, was identical in all respects of merit to their own lumber. It seems therefore, only a question of eliminating an unsatisfactory percentage from the shipments to put the Eastern wood on the same level of excellence as the Western. A great deal of study and care has been given to this point.

The Low Grade Problem Troublesome

The market in the United Kingdom calls for the higher grades of Siberian yellow pine and the difficulty has already arisen of disposing of the balance of the product. The heavy logs now being taken out of the woods running from 20-in. to 40-in. are calculated to give 25 per cent. of 1st quality export planks, etc., and herein lies the chief reason why the export is hardly ever likely to reach big figures. Vladivostock is 12,000 miles from the United Kingdom, the freight £6 to £8 per standard, and chartering difficult. It therefore does not pay to ship anything but first quality, with, perhaps, some seconds, in favorite sizes like 3 x 11 in., and broads. To produce 1,000 standards of first and seconds, the millman must cut, roughly, 4,000 standards, and in the disposing of the 3,000 standards of what is termed out there "Brack," he is up against a very troublesome proposition. Up till now the Russian Government has called for enormous quantities of this lower-grade sawn material for building barracks, etc., and there have been other outlets, which are now non-existent. True, the Chinese Eastern Railway is a big buyer, but one mill can easily supply their yearly requirements. What, therefore, is the millman to do with his 3,000 standards of lower-grade stock, if he is ambitious enough to wish to cultivate export connections for a quantity like one thousand standards? Perhaps the solution lies in the great Chinese market through Shanghai, which absorbs about 150,000,000 feet of merchantable Oregon pine per annum.

The export of wood from Vladivostock made enormous strides in the years 1910-1912, as can be seen from the following table:—

1910.	1911.	1912.
cubic feet.	cubic feet.	cubic feet.
399,700	949,550	1,219,570

Of the 1,219,570 cubic feet exported in 1912, 317,892 cubic feet consisted of yellow pine logs, and 461,032 cubic feet of yellow pine sawn lumber. Owing, however, to the fact that the sale of the production of the lower grades now presents greater difficulties, it is highly probable that 1913 will show a slight recession, and, as far as 1914 is concerned, everything goes to show that the quantity of sawn goods now being prepared at the strictly limited number of sawmills which have remained in the export business will be so small in quantity as to render it unwise to prophesy.

Looking for Wider Markets

There is little doubt, it is stated, that the Siberian and Manchurian timbermen have their eyes on the two immense markets almost at their door, namely, Australia and China. Pacific Coast lumbermen have had these two huge markets pretty much to themselves, but in the face of what follows, it cannot be doubted that before long our American friends will be compelled to contest every Pacific market with the Russians, and it is by no means without the bounds of possibility that the war will be carried into their own Continent. We see no reason why Siberian shippers should not enter the great Argentine market, which takes large quantities of "Select and Better" pine, and even the Eastern States themselves may not be immune.

The article then discusses in detail the shipping facilities at the various harbours in the far east and concludes in part as follows:—The outcome of all this will not be to flood our markets with first quality pine deals and sidings, but Pacific Coast lumbermen who have been in the Chinese and other Pacific markets for years and years are certainly going to feel a bad draught, and it has been suggested that, instead of fighting the competition, the Americans should apply their experience and co-operate with the Russians. It might be argued by readers when they learn of the preparations being made to facilitate shipments at Vladivostock and Nicolaevsk, that the natural result must be to occasion over-supplies of high grade pine. Well, it probably will result in a much larger production of U. K. material, but by the time that the timber industry in the Far East has attained to that condition of development which this article forecasts, the supply of first class pine from Canada may be very much diminished, and so the balance will be maintained.

B. C. Trade Opportunities Neglected

United States Firms Steadily Increasing their Domination in Foreign Markets—Situation Reviewed by Henry Pearse

At a recent meeting of the Victoria, B.C., Board of Trade, an important address was delivered by Mr. Henry Pearse on the export lumber trade in British Columbia.

"British Columbia today is not getting a tithe of the existing Pacific export timber trade. It cannot be a matter of price for the reason that practically the same conditions of production obtain all along the Pacific Coast. It must be because we are not commercially equipped to handle the business that is offering." Mr. Pearse's remarks were opened by this statement, which formed the basis of what he had to say on the subject. He referred to the fact that the United States, through its Department of Forestry, assisted by their commercial departments, were demonstrating to the timber consuming countries how valuable was the Pacific Coast timber. Brochures were published declaring that "Douglas fir may be considered as one of the most important of American woods." He added, however, that the average importer would imagine that the northern Pacific Coast "began and ended with the United States." Something ought to be done, he claimed, to bring British Columbia more prominently before the importing countries. Without action British Columbia would not for many years get anything near its fair proportion of the export business.

"It is not sufficient," Mr. Pearse continued, "for the milling industry here to sit down and say that, with the opening of the Panama Canal, everything will come right. It is not sufficient for the government, Dominion or Provincial, to say that the country possesses the supply and therefore, when the demand comes we shall get the business. With the exception of the United Kingdom and the eastern United States markets, the Panama Canal will have little geographical effect on the export trade. There is a slight advantage in exporting to South Africa, but the larger markets such as the Argentine, the Orient, and Australia are not affected by the canal route. From an experience gained during the last twenty years, of the export produce trade, I say most emphatically that unless some provision is made immediately, whereby the world's importers are educated to the fact that British Columbia possesses a large quantity of timber, and is able to export that timber, the United States will dominate the whole of the trade on the Pacific Coast and put back the industry in his province a decade."

Significant Figures of Foreign Trade

Going into his subject in detail Mr. Pearse observed that he thought it could be proved by statistics that there was a reason for British Columbia's failure to get a fair share of the business. "Twenty years ago," he said, British Columbia was shipping 34,000,000 feet out of a total of 111,000,000 feet shipped from the Pacific Coast to Australia, South America, China, Japan, Mexico, Central America, United Kingdom, Europe, Africa and other foreign parts. In 1913 the province shipped to the same countries 47,000,000 out of a total 600,000,000. Twenty years ago British Columbia enjoyed more than thirty per cent. of the Pacific export trade. It now is content with less than eight per cent.

"Taking Australia alone—in 1912 British Columbia shipped 25,000,000 feet out of a total of 199,000,000. In 1913 British Columbia shipped to Australia 10,000,000 feet out of a total of 238,000,000 feet. The British Columbia shipment to Australia in one year decreased 15,000,000, i.e., sixty per cent. and the American shipment increased 39,000,000 feet, i.e., twelve per cent.

"The chief consumers of Pacific Coast timber are Australia, West Coast of South America, and China, who take 460,000,000 out of a total 600,000,000 exported. The next largest consumer is the United Kingdom, which, in 1913, took 45,000,000 feet."

Mr. Pearse went on to quote from an article by Major H. G. Joly de Lotbiniere, published by the Quarterly Review in September, 1913. This gives some interesting figures with respect to the lumber export trade and there was one paragraph of significance, it follows: "With the opening of the Panama Canal, we (England) shall no doubt for some time to come, receive large quantities of Douglas fir, a species which has been introduced into this country (England) as a forest tree and promises exceedingly well; but British Columbia timber will be in great demand in China, Australia, United States and South America, and we cannot count upon receiving a permanent supply from this source."

At this point Mr. Pearse quoted some interesting figures: "Eighteen years ago the shipments from the Pacific Coast to China and Japan were: 'Washington and Oregon—22,499,767 feet, B.M.; British Columbia—15,550,324 feet B.M.; total, 38,050,091 feet B.M.

"In 1913 Washington and Oregon—122,442,362 feet B.M.; British Columbia 5,176,157 feet B.M.; total, 127,618,519 feet B.M.

"The shipments alone to China were: Washington and Oregon—106,429,576 feet B.M.; British Columbia—452,412 feet B.M.; total 106,881,988 feet B.M.

"The figures," he added, "relating to Chinese shipments are so extraordinary that the only explanation is that the Puget Sound shippers have sent their boats up to British Columbia ports, get cargoes and shipped Canadian lumber as American. If this is the case it only makes the state of our export lumber industry more serious."

The Explanation

Commenting on the reason for this decline in the export trade Mr. Pearse said that it could not be that the local demand exceeds the supply, because the unfortunate fact was that many of the mills have had to close down. He declared that it was not that the competition was so strong that the mills were selling at a loss on the other side. "Competition never sells at a loss for long," he observed, and this gradual decline in the export trade has been going on for the last twenty years.

After characterizing the British Columbia mill owner as a practical man, knowing his logging and milling trade, but not the shipping trade and import markets of the world, Mr. Pearse declared that it was absolutely necessary, in the interests of the industry, that an Inspection Bureau be established in British Columbia. It ought to be, he maintained, under the control of the Forest Branch of the Department of Lands and one of its functions would be to certify officially the grade, and tally all the shipments from our ports. There was no reason why this should be any expense to the government. In the profit and loss statement of the American Inspection Bureau for the year 1913, the gross income was \$44,118.54 and the gross operating expenses \$39,545.66. It was a well-known fact to anyone in the produce trade that all foreign countries would rather handle produce under an English certificate and through an English broker. This was incontrovertible and was easily proven by the fact that England herself was practically a clearing house for the world's produce.

British Columbia would be an important factor in the timber markets of the world. The demand was enormous. The English Board of Trade returns for 1911 showed that the United Kingdom imported over \$140,000,000 worth of coniferous timber in that year. Their supplies were drawn chiefly from Russia, Sweden, and the United States. He then went into minute particulars of the growing markets of Russia, where the population was increasing at the rate of 2,250,000 a year and where half the annual growth of the country's forests was being cut; of Sweden, where the export of structural timber had remained stationary for the last twelve years; of the United States, where the original forests had been reduced in area from 850,000,000 to 550,000,000 acres, and of other nations.

This Province, Mr. Pearse asserted, had in the Douglas fir, a product that, for beauty of appearance, strength, and ease of working was unsurpassed by any timber that could be largely exported. The United States realized this superiority when it devoted several years of a technical investigation of the properties of this wood and established standard functions for use in designing structures in which Douglas fir was used.

"In December last," continued Mr. Pearse, "I wrote to the Chamber of Commerce, Melbourne, asking to be put in touch with one or two of the large timber brokers and importers. The response was most extraordinary. Every firm that wrote to me expressed surprise that British Columbia did not do more direct trade with Australia and that more information was not available as to the merits of our fir as a structural timber. I am now in communication with China, South Sea Islands, United Kingdom, South Africa, India and South America and am quite satisfied that the same opinion will obtain in the minds of the importers of the different countries enumerated.

"Take the Argentine trade alone—the Mexican Gulf last year shipped nearly 400,000,000 feet of yellow pine, most of which went to the River Plate ports. A study of the map will show that the distance direct from New Orleans to the River Plate is not much less than B. C. to River Plate through the Magellan Straits."

Mr. Pearse declared that the industry had suffered generally by many over-capitalized companies. The solution lay in the employment by the Canadian Government of a man conversant with the shipping and export trade and having knowledge of the local conditions obtaining in the lumber industry of British Columbia. He should be invested with as much dignity as was possible to make him an accredited representative of the Canadian lumber industry and he should visit the markets of the world and interview the several importers and shipping companies. Notwithstanding the labor

conditions here, there were markets today in this world ready to take the Douglas fir at a price that would pay handsome profits.

Mr. Pearse concluded: "We have a sufficient supply of matured timber on our land to build up industries that would pay tens of mil-

lions of dollars in wages annually. I have proved that there is an enormous and largely increasing demand. Shall we be content to wait for years and years, until, by the insistence of demand over supply business will drift to us? Or shall we reach out and take it now?"

Merchandising of Lumber

From the Standpoint of the
Wholesaler and the Retailer
By Julius Seidel*

I very much fear that that policy of merchandising which is current with the most progressive ideas in other lines of manufacture has not received that attention on the part of lumber manufacturers which it deserves. But that censure is also merited by all the branches of the lumber business—mill interests, wholesaler, and retailer.

We have been lacking in the art of so merchandising as to continue being an attracting force to those who were our best customers, and are failing as well to sufficiently interest those to whom future developments may make us one. We are dealing in lumber, the article that helped civilization to populate the new world, lumber that was as available as it was useful, lumber that was as workable and bent itself to the effort of an ordinary workman as well as it did to the effort of a skilled mechanic, lumber, an article which in its varieties was boundless and adaptable to all kinds of uses in the localities where it grew.

Consequently lumber merchandised itself—it did not need much advertising—it almost sold itself. The methods of merchandising to-day are, therefore, based more upon what was, than what should be—and the advertising of lumber, while of utmost importance, is secondary to the fundamentals of merchandising.

Lumber Merchandising—the Wholesaler's Standpoint

In discussing the merchandising of lumber, I do so from the standpoint of a wholesaler with a yard to back me up, and also from the standpoint of a retailer distributing in a large city. Let us, therefore, first consider the changes in location of forest supply; then the change in local demand; the character of a city's lumber demand and its changes, as compared with that of town or village. We can then see where the substitutes propagate and why they succeed. We must be awake to the transformation from a developing community to one of permanence, as it takes place all over the country, and under this head would come building construction, railroad work, street work, bridges, etc.

When we weigh all of these factors in our minds, we cannot help but reflect upon what is necessary to keep "our business" a business. Let us consider the former manufacturer of a time when smaller mills which were sawing wood were one of the mainstays of a community.

Did you ever stop to consider the local pride that attaches itself to boosting the product of a "home" manufacturing plant—would not the employees as well as the dependents act as boosters? Do you also appreciate the influence in his community of the proprietor and his woodworking force, now manufacturing the wood competitors, a force that the sawmill wielded? Do you not believe his employees are tooting their horns about their products? Would you expect an employee of a wall board factory to use a wood ceiling, or an asphalt shingle maker to buy wooden shingles? Think about this and then let me get back to the old mill town. Most of those old mills have vanished and we find our source of supply at far-off points, with distances varying from 250 to 2,500 miles.

The Change of Mill to New Fields

A great many of the mill men have migrated from these forest countries to new fields, and this marks the beginning of a change in the merchandising of lumber. The yard was liquidated, or perhaps sold out to some successor.

Here it is where the manufacturer separated from retail merchandising. The manufacturer has, however, tried to continue in his paternal power of merchandising his lumber. He seems to forget, in a measure, that his personality has passed away from his old community—that he surrendered his right of "eminent domain" to another, and he must recognize this condition of affairs. We say, therefore, "All hail to the old man"—he's as fine a fellow as walks the earth—but he's been bossing so long that he kind of overlooked the kid who has grown gray-haired and ought to have a look in once in a while, and a say so, too.

Now, why should the wholesale yard man be tolerated? Can the mill man successfully sell direct with lumber receding from the main centers of demand? There are other trades establishing branches of their own, or agencies, so as to be before, and nearer to, the people and to offer to furnish them supplies quickly. Here are the lumber-

using communities demanding an assortment of all the new kinds of lumber coming into prominence. Who will put his money into them? Can you, Mr. Manufacturer, overlook your boy, the wholesaler, and your boy, the retailer, when you outline a national campaign?

What is the wholesale yard doing for you right now? Nothing less than bringing the forest back to the doorstep of the consumer. The wholesaler has returned to what was your home town in the forest area. The wholesale yard is trying to build up lumber and continue lumber for a real market, where you can get what you want in or out of season at a marketable price. It is selling to the smaller yards of the country, who cannot buy straight carloads of the new kinds of wood, since their communities would not consume them within a period commensurate with the investment.

Overstocks in Small Yard

You cannot expect a retail lumber yard to keep a \$20,000 stock in a community that uses only \$20,000 a year all told, and still keep all the types to be considered as "progressive." The source of supply being so far away makes it hard enough for the retail yard to anticipate the demand, not to speak of the difficulty it has of taking its place in line and waiting for cars besides.

The wholesale yard, therefore, in my opinion, must take a large part in the introduction of new woods as relay stations or storage yards. So the wholesale yard, at any rate, saves the retailer from the instability of the market, or on slow-moving items.

Quite a difference in this method from that of "The Weather Bird" merchandising of the mill man under the "subject to prior sale" slogan. The sales manager gets to the office, opens your mail, sees orders in sight for eight cars 2 x 4-16 ft.; you consult the barometer and find seven more cars with the other boys about town—result, clear sky for 2 x 4-16 ft. So take in sail, turn back half the orders and raise the quicksilver two points. How about No. 2 boards? Heavy gale, looks cloudy—drop your quicksilver, and so on until you scrape the bottom of the harbor.

Should Lumber Be a Stable-Priced Building Article?

Now, should merchandising in lumber be a speculative game, a wheat pit drama, or should it be a stable business? If we believe in lumber as a stable commodity, can these conditions be remedied? And is our "latter day way" of mill marketing correct and conducive to the making of friends among the family, or of discord and distrust? How can the public have confidence in a double-edged proposition? In the fall, when other lines want business, look for it, prepare for it, we have to stand for the boost; tell the buyer about the waning forest supply, and next spring tell him that the forest has expanded and prices are going down. The wholesale yard is stable—it quotes a positive price, which must by the very nature of things, be on the market; it acts as a promoter of the use of lumber, because it keeps the full line and has the pleasure of roosting on a volcano of changing market conditions.

The wholesale yard keeps a complete line of all the commercial woods and must of necessity have a large capital invested in the newer kinds of wood seeking a market. Once it has them in pile, they claim much of the yard's attention, since a market must be found and developed, or money lost on the investment. Now, I do not relate these stories from humorous motives. There is, though, humor in them—but grim reality will lead you to believe that there is too much poker playing among the members of your own family.

This brings up right up to the stern reality of the question why substitutes are gaining ground with the distributing, or retail yard. Mr. Substitute has a policy in his merchandising, a fixed policy. His price is established and is not subjected to the daily price barometer, the "Weather Bird" price.

Relation of Mill Wholesaler and Retailer

Now, take the wall-board people. They have their agencies who buy carloads, who take care of the jobbers at a fixed percentage of profit, thus giving the retailer a positive price to work on. Now if they work the small buyer earnestly, the latter, the retail yard, can become a car buyer, that meaning a hope of reward for his trouble in the shape of the jobbers' extra profit. Worth working for, is it not?

*Address delivered before National Manufacturers' Association at Chicago.

Compare this kind of merchandising with ours. How did your books look to you in December—just like the weather, cold and dreary? But, why worry? We are the most Christian people on earth, and oh! so hopeful that the future may be bright.

Naturally a dealer does not like to sacrifice real money on a staple commodity like lumber and, mind you, through no fault of his. He is trying to do his duty by the community by keeping a full line, and a change of six dollars a thousand on common lumber between high and low point inside of a year is not justified. It is not a fair difference to a mill man, wholesaler, dealer, or buyer. As a matter of course, a dealer is in business to make his living by it, and while he wants to defend lumber against substitutes, he must defend his investment against loss, and the substitute has it on us when it comes to that.

Changes in Building Codes

It is the dealer's duty to watch the building codes in his community and have lumber receive its due consideration. Let us be justly fair, and not fairly just, in speaking of cement, brick, tile, slate and iron. The types of heavy, enduring structures that tower to the sky and which issue bonds, often for ninety-nine years, must guarantee indestructibility. 'Twas ever so long before the Christian era that in the enduring monument stone was used.

But we have field enough in business structures where lumber offers safety, chance for remodeling and expansion, in connection with low cost. We are not all building monuments for the future.

The dealer must be more interested in the styles of lumber. He should push the bungalow idea of building. Push the double floor idea for insulation and deadening of sound. Encourage the architect to specify beamed ceiling in the dining and living rooms, to show the beautiful effects that can be secured out of wood products, and thus keep up with the style.

As an illustration of what a dealer can do, I will mention that for five years we have been pushing oak flooring. Some circular matter about sanitary linoleum and oil cloth reached me at my home and set me thinking.

Oak flooring, the most beautiful and sanitary of woods, it struck me, did not even have a look-in on the business, or a friend to talk for it. So we put out 10,000 circulars, with a color-tone of oak flooring in its natural color. We sent these to carpenters, business men and tradesmen of every kind, telling of the sanitary qualities of oak flooring; said that we would make them a lump price on laying a floor complete, waxed and varnished. We, of course, told our customer, the floor layer, all about our move—working with him—as all we wanted was the floor out of it.

Then we put in a separate circular for lumber, telling these same consumers that we would deliver to them any quantity of lumber, cross-cut, ripped, dressed up, neatly bundled and tied with a blue ribbon ready for use. These circulars attracted attention to lumber. We did not get all the business that was created by it, but we got some of it, and the other boys got some. Now, the sawmill doth not like to make specials—it wants to standardize the sizes—wants to make a ready-made clothing affair out of all its lumber, but there are many people who want odd things that everybody does not have, just as you want your suit tailor-made of original design and imported woolen. Everybody does not want beaded ceiling like grandpa used. It's time we got up some new patterns.

Sell What Your Customer Wants

The dealer should be prepared to cater to these whims and "get out lumber to order" with just as much pleasure as the staples.

Lumber in the future will have to be furnished in a most complete utility state from year to year. The shop work of the carpenter is a past issue, because machinery can do it better and cheaper. Sash and door houses furnish sash primed and glazed. Yes, they furnish doors and jambs filled, varnished and fitted, ready to set in the wall, and casing cut to length and coated. Why should we not learn from them a valuable lesson?

We have been following the path of least resistance in the retail line. We want to deliver lumber in the crude, realizing while we do it that hand-work at the building site may make the articles, when in place, higher than eye-beams, expanded metal, and other things that are after us competing for the same order. The advertising of finished house patterns is only a forerunner of what we will come to, or rather should have proposed for certain houses long ago. We should not censure the concerns who advertise finished cut-to-order patterns, but should be on this job and learn, learn and learn, and think, think. The retail yard will, in certain localities, have to put in machinery to handle this business. Last year we handled a shelving order of \$4,000 cut to size. Who knows but if we had not had the facilities to do this work that the wire rack or ornamental iron form would have gotten the business? And others can do as well.

Lumber Treating

If treatment of lumber is to be promoted, we must not overlook

this, namely; that the lumber retailer or his nearby wholesaler will have to take care of the local man wanting small quantities who cannot offer a treating plant a drum full at one time, yet needs to have your attention and consideration, because he is a true friend of the lumber product.

Gentlemen, there is light ahead. There have been types of trees put into lumber sizes for which, by their worth and character, they were not intended. But the Panama Canal will help our business to keep only the higher types of trees into their enduring places so that the third-grade and inferior kinds from cut-over land will take their places and step down to the uses for which they are properly adapted.

This subject might be likened to the broad ocean, whose waves touch many shores, and for the short time at my disposal I have endeavored only to cover the most important as they arise, like the sun of the day, above the water line. The modern way is to diagnose a case before you operate, and we must touch upon the symptoms first to arrive at a conclusion—so I would call this a diagnosis with some suggestions of a remedy.

There is need of more family reunion—the mill man has been busy—the wholesaler has been busy, and the retailer has been busy, each interest intent upon solving this great and stupendous undertaking of the merchandising of lumber, and solving it right. May the brotherhood of the forest stimulate closer and more endearing relations for the future between us all.

Michigan Hardwood Manufacturers Optimistic

Market conditions in Michigan were reported upon at the spring meeting of the Michigan Hardwood Manufacturers' Association on May 5. The market committee stated that sixteen lake shippers report 15,164,000 feet of maple lumber available for flooring purposes on hand as against 15,367,000 feet on hand one year ago. The same sixteen members reported sales last year of 29,206,000 feet as against 26,890,000 feet for sale this year. The committee report also stated that three large shippers, not members of the association, who cut 7,000,000 feet of flooring stock last year are now out of business. This with the 2,316,000 feet less to be sold will reduce lake shipments of the stock by 9,316,000 feet. It was also shown in the report that maple lumber available for flooring in the hands of rail shippers, is practically all sold at last year's figures or better and the flooring business is in good condition and the manufacturer fully able to pay the prices prevailing last year. The report predicts that prices will remain firm. Owing to the restricted privileges governing transit shipments the committee has discovered that many jobbers have discontinued business so far as maintaining yard stocks is concerned, and it is a known fact that there are few stocks in the hands of the middleman from which consumers can draw their supply of rough lumber. At the same time wood-working factories are mostly running and depleting their reserves, and consequently in the near future this will make it necessary for them to seek the producer to secure their requirements.

The estimated cut for 1914 secured January 1 was 458,000,000 feet. On account of the open winter estimates were again taken April 1 and found to be 450,000,000 feet.

It is the opinion of the committee that the lumber business has suffered less than any other of the great industries of the country, and the Northern hardwoods less than any other branch of the lumber business.

Canadian Western Report on Year's Business

The report of the Canadian Western Lumber Company, Limited, Fraser Mills, B.C., for the year ending December 31st, 1913, contains the following reference to business conditions:—"Early in the year acute stringency made itself felt in the building trade throughout Western Canada, resulting in a large decrease in building operations, and also obliging retail lumber dealers to make large reductions in stocks on hand. All this resulted in a sudden and very heavy falling off in the demand for lumber. As a consequence, the company did not put into operation the two new sawmills, which were completed early in the year. As the depression continued it was decided in August to discontinue night operations. These have not been resumed.

"The lumber manufactured for the year was 130,155,641 feet, a falling off, compared with the previous year, of 34,905,761 feet. Lumber sold aggregated 120,982,383 feet, a decrease of 3,303,050 feet compared with the previous year. Owing to the depression the logging camps operated only ten months during the year, but during that time produced 124,542,420 feet compared with 107,504,670 feet in 1912, an increase of 17,037,850 feet.

"In common with other companies, and as a result of increased wages and increased cost of supplies, which became effective at the first of the year, manufacturing costs show an increase over 1912. Owing to extensive reductions in wages during the last month of the year, which are still effective, the directors hope that the costs for 1914 will get back to the basis of 1912.

Judgment Given in Ottawa Freight Rates Case

The Dominion Board of Railway Commissioners gave their decision on May 12th in connection with the application of the Canadian Lumbermen's Association and the Montreal Board of Trade to prevent the railway companies from charging a domestic rate on lumber from Ottawa to Montreal of 6 cents per hundred lbs., and also a 6c export rate. By a former judgment of the Board the railway companies were permitted to charge 7c a hundred lbs. as a domestic rate and were ordered to charge a lower rate for export shipments. They made a practice, however, of charging 5c per hundred lbs. from Ottawa to Montreal during the summer months so as to meet water competition. This year the railways decided to charge 6c during the summer, as water competition is not so keen as formerly. This 6c rate applied to both domestic and export shipments.

The Board now finds that the railways are entitled to charge 6c for domestic rates if they wish, but that for export shipments from Ottawa to Montreal, they must put into effect within one week, a tariff establishing an export rate from Ottawa to Montreal of 5c per hundred lbs. and rates from points governed by the Ottawa rate, in proper relation thereto.

Toronto Lumbermen's Club Looking for Quarters

During the past fortnight, the Lumbermen's Club of Toronto has held a number of luncheons and the members have discussed very thoroughly the whole club situation. This has led to a very general and definite conviction that the formation of a club is a wise and important step. The discussions have centered about the various kinds of lumbermen's clubs existing in other countries and the best kind of a club to organize in Toronto. At present, the general opinion is in favor of a club starting out very largely as a social organization, having rooms in connection with some hotel or restaurant where luncheon may be served daily, and where members may be able to meet one another or bring their out of town friends for luncheon or to meet other members of the trade. A special committee is at present looking carefully into available quarters in the business part of the city, and, as soon as they have a satisfactory report to present, it is expected that a definite step will be taken in the way of organizing the club and establishing it in its own quarters.

Finds Ontario Hardwood Trade Optimistic

Chas. O. Maus, Atlantic City, N.J., eastern representative of the Hyde Lumber Company, South Bend, Ind., was in Toronto recently on a business visit. The Hyde Lumber Company manufacture hardwoods, particularly cypress, oak and gum, and operate mills at Arkansas City, Ark., Millikin, La., and Lake Providence, La. Up to the present, the Hyde Lumber Company have been content with covering the Ontario trade by correspondence. Their business in Ontario has grown so satisfactorily that Mr. Maus will now make regular visits to Ontario and call upon the trade personally. In conversation with the Canada Lumberman, Mr. Maus said that he found a very optimistic spirit prevailing among the Ontario trade at present. They were buying fairly well and assured him that a renewal of good times could be counted upon in the near future. "The situation as I found it," said Mr. Maus, "has been good, and I have been very much pleased with trade conditions—more particularly when comparing Canadian trade conditions with those of the United States. While the trade in the United States has fallen off somewhat, this is more due to the dissatisfaction of the railroad companies in regard to freight rates, the Mexican war situation, and the over-buying by most of the large manufacturing concerns a year and a half ago. These firms are now retrenching and I look for renewed heavy buying in the United States some time next fall. The enquiries from Canada have been so encouraging that we have decided to make our initial personal visit here and I assure you that we have found conditions very pleasant."

Mr. Maus, in conclusion reiterated his views in regard to the better feeling existing in Canada and expressed the great pleasure it had given him to become personally acquainted with a number of Canadian lumbermen, for whom he had many complimentary remarks to make.

Forest Products Exposition Successfully Opened

The first Annual Forest Products Exposition, held under the auspices of the National Lumber Manufacturers' Association, opened in the Coliseum at Chicago on April 30th. The proceedings of the opening night were in the nature of a reception and "dress rehearsal." Many invited guests were present representing important associations connected with the lumbering industry. The transformation of the great Coliseum building was complete and wonderful, and the decorations were remarkably beautiful. The entire space in the main building was filled with interesting exhibits arranged with great care and skill, conveying forcible object lessons in connection with the

value and importance of wood. Very complete arrangements were made for the entertainment of visitors who travelled to Chicago to attend the exposition. The Lumbermen's Association of Chicago made the visitors welcome at their booth and special committees were appointed to look after the entertainment of visiting lumbermen on the different days of the exposition. Among the important exhibits at the exposition the following were particularly noticeable: Western Pine Manufacturers' Association; Hardwood Manufacturers' Association of the United States; Yellow Pine Manufacturers' Association; E. C. Atkins & Company, Saw Manufacturers; Northern Pine Manufacturers' Association; Southern Cypress Manufacturers' Association; North Carolina Pine Manufacturers' Association; Gum Lumber Manufacturers' Association; National Association of Box Manufacturers; West Coast Lumber Manufacturers' Association; Redwood Mill Owners' Association; The Oak Flooring Manufacturers' Association; The United States Forest Service, and The Western Forestry Conservation Association. In the annex to the Coliseum a number of wonderful moving picture shows were installed. For many months skilled photographers have been busy collecting for these exhibits. They illustrated every phase of the lumber industry from the felling of the giant trees to the completion of the finished product.

Large B. C. Timbers for St. John, N. B.

An interesting shipment of long Douglas fir timbers was recently made by the Canadian Western Lumber Company, Fraser Mills, B.C. The timbers were shipped from the Pacific to the Atlantic Coast, on one line of railway, making the journey in 24 days. The accompanying illustration shows these timbers, shipped in a twin-load, when they were leaving the plant of the Canadian Western Lumber Company. Their destination was St. John, N.B., where they are now be-

From Fraser Mills, B. C. to St. John, N. B.—An Interesting Shipment of Long Douglas Fir Timbers.

ing used for anchors on the large dredges working on the St. John harbor. These timbers are 18-in. x 24-in., 20-in. x 20-in. and 24-in. x 24-in., 60 ft. and 70 ft. long. The logs were taken from "the last best stand of timber in the world"—i.e., the Douglas fir of Vancouver Island. They were rafted from Vancouver Island to the booms of Canada's largest sawmill, that of the Canadian Western Lumber Company, and there manufactured for shipment to St. John. The Canadian Western Lumber Company are equipped to cut timber 120 feet in length and have reduced to lumber logs measuring 9 feet in diameter.

Increased Shipments from Pacific Coast to England

The Timber Trades Journal, London, England, in its issue of April 25th has the following to say regarding shipments of Pacific Coast Lumber to the United Kingdom:—

"While the gradual development of Pacific Coast lumber exports to this country is known, it is not largely recognized what rapid strides are being made. We have before us a return showing the shipments from California, Oregon, Washington, and British Columbia during 1913, which shows that vessels were chartered for United Kingdom ports, including, London, Greenock, Liverpool, Newport, Newcastle, Glasgow, Queenborough, Swansea, Belfast, and sundry other ports, for an aggregate of no less than 38,668,686 superficial feet. Of course, a certain quantity of this found its way to the Continent, but the total shows the large proportions which this trade has now assumed. By the way, the "Harold Dollar," now being built for the Robert Dollar Steamship Company, of San Francisco, will be the largest lumber-carrying vessel in the Pacific service, having a capacity of 5,000,000 ft."

Practical Belt Lacing Directions

Description of the "Hinge" and the "Straight stitch" Methods—The Two Most Common Plans

There are several methods of joining the ends of a belt by means of rawhide lace leather. The two most common and practical plans for lacing belts are known as the "Hinge" lacing and the "Straight Stitch" lacing. Whatever style of lacing is adopted, it is imperative that the ends of the belt to be joined should be cut at exactly right angles to the sides of the belt, and that the lacing be under uniform tension in order that the belt may run absolutely true when put into operation. Cut the ends of the belt to be joined perfectly true with a tri-square. Punch two rows of holes in each end of the belt. The holes in the second row should be punched directly back of those in the first row. The holes in both ends of the belt should also be exactly opposite.

No holes should be less than one-half inch from the edge of the belt, nor nearer to the end than one-half inch. The holes should be spaced about three-quarters of an inch from centre to centre.

Directions for Lacing

Put the lace through hole No. 5, drawing ends even. Butt the ends of belt together and pass each end of the string of lace between the ends of the belt as shown in the following illustration.

Pass No. 1 lace up through hole No. 8, down between ends of

The "Hinge" lace looks alike on both sides and gives very pliable joints.

belt, up through No. 5, down through No. 2, up through No. 5, down between ends again.

Put lace No. 2 down through hole No. 8, up through No. 11, down through No. 8, up between ends, down through No. 4, up between ends, down through No. 7, up between ends, down through No. 4, up through No. 1, down through No. 4, up between ends, down

The "Straight Stitch" on Grain (left) and Flesh sides of Belt.

through No. 7, up through No. 10, down through No. 7, up between ends, down through No. 4, up through No. 1. Punch hole with belt awl and fasten in usual manner directly back of hole No. 1.

To finish the other side, put lace No. 1 through hole No. 9, down between ends, up through No. 6, down between ends, up through No. 9, down through No. 12, up through No. 9, down between ends, up through No. 6, down through No. 3, up through No. 6, down between ends, up through No. 9, down through No. 12, then fasten end of lace back of hole No. 12 in the usual manner.

The illustration used with these instructions shows only three holes to each row. The same instructions apply whenever any odd number of holes are required to each row—simply start with the centre hole.

When the width of the belt requires the use of an even number of holes in each row, begin with either one of the two centre holes and follow the instructions already given.

Cut the ends of the belt to be joined perfectly true with a tri-square. Punch one row of holes in each end of the belt. The holes in both ends should be exactly opposite.

No holes should be less than one-half inch from the edge of the belt, nor nearer the end than one-half inch. The holes should be spaced about three-quarters of an inch from centre to centre.

Directions for Lacing

Butt ends of belt together. Put lace through holes No. 3 and No. 8 from the grain side, drawing ends of lace even, see the following illustration.

Put No. 1 lace up through hole No. 3, down through No. 8, up through No. 4, down through No. 9, up through No. 5, down through No. 10, up through No. 5, down through No. 10, up through No. 4, down through No. 9, and up through No. 3. Punch hole with belt awl and fasten in usual manner directly back of hole No. 3.

Put lace No. 2 up through hole No. 7, down through No. 2, up through No. 6, down through No. 1, up through No. 6, down through No. 1, up through No. 7, down through No. 2, and up through No. 8. Fasten lace in usual manner directly back of hole No. 8.

The illustration used with these instructions shows five holes to each row. The same instructions apply wherever any odd number of holes are required to each row—simply start with the centre holes.

When the width of the belt requires the use of an even number

Starting a "Straight Stitch" with odd number of holes.

Starting a "Straight Stitch" with even number of holes.

Starting a "Hinge" lace.

of holes in each end of the belt, lace in accordance with the following directions:

Butt ends of belt together. Put lace up through holes No. 3 and No. 6, from flesh side (see illustration), drawing ends of lace even.

Put lace No. 1 down through hole No. 7, up through No. 4, down through No. 8, up through No. 4, down through No. 8, up through No. 3, down through No. 7, up through No. 2. Punch hole with belt awl and fasten in usual manner directly back of hole No. 2.

Put lace No. 2 down through hole No. 2, up through No. 5, down through No. 1, up through No. 5, down through No. 1, up through No. 6, down through No. 2, and up through No. 7. Fasten lace in usual manner directly back of hole No. 7.

The illustration used with these instructions shows only four holes to each row. The same instructions apply whenever any even number of holes are required to each row.

An Important Timber Transaction

One of the largest land transactions recorded in Quebec province was announced recently, involving the purchase by the Chicoutimi Pulp Company, which is now turning out six hundred tons of wet pulp daily, of one of the largest areas of freehold property in the world. The company has purchased from the Atlantic, Quebec & Western Railway 400,000 acres of freehold pulp wood lands, which was formerly given to the railway for the construction of 100 miles of railway line, extending from New Carlisle to the Gaspé Basin. This area is located along the branches of the Upper Peribonka River, a stream a mile wide in some places and running into Lake St. John.

It is said that the company selected the acquired virgin forest lands along the northern sections of this river in preference to areas further south, for the reason that while a great broad river connected them with the south, no railway within many miles made forest fires at all probable. A second block of freehold land now in possession of the same company, amounting to 110,000 acres was accorded the Roberval & Saguenay Railway, which has already built forty miles from Ha Ha Bay to Chicoutimi, and will continue the same line on to a further distance of sixty miles next year, to the Mistassini River

Mountain Lumbermen Hold Business Meeting

A general meeting of the Mountain Lumber Manufacturers' Association was held at Nelson, B.C., recently, at which it was reported that American competition was still very keen in the Pacific provinces, the imports for the first three months of 1914 having been about equal to those of the corresponding period in 1913. The opinion was very generally expressed that no relief could be expected in this regard until the Dominion Government would give protection to the industry by means of an increased tariff.

Reports which were presented showed that the information bureau of the association had proved very valuable. The bureau gathers reports of all business booked by Canadian operators and distributes it to the members of the association. In this way an excellent idea is secured of market conditions in the Prairie Provinces.

The members present expressed their gratification at the order of the Railway Board which had recently been passed, conforming the western freight rates judgment which placed main line points on the same basis as those in the Crows Nest from a lumber shipment point of view. Formerly the main line shippers were charged a higher rate on account of the haul through the Field tunnel.

A report was presented to the effect that the Canadian Pacific Railway department of natural resources is making special efforts this year to increase settlement along the company's lines. It is expected that this policy will prove advantageous to the lumbermen by stimulating the demand for their products.

Mr. W. A. Anstie, managing director of the Forest Mills of British Columbia, Limited, Revelstoke, B.C., was appointed to represent the association at the conference which is to be held between lumbermen and forestry department officials at Victoria for the purpose of discussing the administration of the new royalty act.

The association refused a request from a large retail lumber firm on the Prairies which asked that the Mountain lumbermen should discontinue the practice of selling direct to elevator companies, and that they should make their sales through the retailers.

The association commended the action of Hon. W. R. Ross, Minister of Lands, in arranging for efforts to increase the export markets for British Columbia lumber and timbers.

Mr. N. J. Eastman was appointed grading inspector for the association. Mr. Eastman has had a varied experience in the lumber business in the mountain district of British Columbia, and, until recently had been with Mr. W. C. E. Koch, the Slocan Valley Lumberman.

Lumbermen Co-operating in Vancouver Pageant

It is expected that all the leading lumber mills in New Vancouver, B.C., will be represented in the lumbermen's pageant parade to be held in connection with the Pacific Coast Ad Men's convention on June 12th. The Canadian Western Lumber Company, which operates the largest plant in the Dominion, will exhibit floats in the parade, and the manager has signified his wish to co-operate in securing animated pictures of the mill and plant in action. The promoters of the parade are arranging for a series of views of the different branches of the lumber industry, which will be shown with the photographs of the parade. Panoramic views of the various mills on False Creek and Burrard Inlet are being taken. These, in addition to showing the extent of the timber industry, will also be a valuable publicity factor in advertising the city, it is pointed out. Arrangements are being made with leading film exchanges for handling the sets of pictures and distributing them all over the American continent and Europe.

Wider Field for Plain Oak Furniture

Plain oak is coming back after years of neglect. Little of it has been in evidence for a long time. Fashion dictated the use of other woods, but fashion in that line has about run its course, and indications point to an early and general return of plain oak in the furniture trade, says Hardwood Record. Quartered oak, also, is due for wider employment in the manufacture of furniture. That is, the oak is extending its field of usefulness in most kinds of furniture. For some years this wood has been confined largely to the office and the dining room. Desks and cabinets of oak have been manufactured in large quantities and in numerous styles, and dining tables, sideboards and other appurtenances of the dining room have followed that fashion. In the making of other classes of furniture this splendid wood was accorded scant courtesy. Birch, gum, maple and other hardwoods had the center of the stage. These are fine woods, but no finer than oak, and the superior place accorded them was dictated by fashion, which is often as much a law in trade as in the social affairs of men and women.

It, therefore, becomes a matter of quiet satisfaction to note a tendency on the part of oak to come into the general furniture field again. Plain and quartered oak alike have a place, and by right they never ought to have lost any part of that place. Their substantial qualities ought to place them among woods like gold among metals, superior to vicissitudes of fortune, and beyond the fickle influences of fashion.

The tendency is indicated by the appearance of oak furniture in show windows, where it is more prominent than it had been in a long time. This is the situation, not in a single city or manufacturing district, but it is so general that the movement cannot be defined as restricted or local. A popular form of library table has a quartered veneer top, while the frame is made of solid plain oak. The table is not elaborately finished. It is simply a substantial piece of oak for the library. Many pieces on display are finished natural and they afford pleasing contrasts with some of the deep-stained woods.

Advice to Woodworking Machinery Buyers

In buying woodworking machinery one or two considerations present themselves, and cannot, in fact, be ignored with impunity. The first in importance is rigidity of construction, a very necessary condition on account of speed of working, the quality of the work, and the liability to breakdown, with attendant cost of repairs and loss of production while the machine is undergoing repair.

It is very seldom—and only in special cases where machines are required for temporary use—that it is a business proposition to sacrifice rigidity to so-called "economy" in first cost. This stricture applies with additional force to the buying of second-hand machinery. I quite agree with a writer who said recently that "It is better to borrow money to buy new machinery than to lose money operating machines that are out of date in the matter of economy of production; but the best plan is to set aside a machinery fund each year before declaring a dividend, for then it is easy to keep up-to-date without having to go in debt."

And machines are quickly out-of-date now-a-days, because competition is always demanding something better of the engineer, both on his own account and also to enable the woodworker to increase and improve the production of the machines. Moreover, rigidity is required, not only because of the greater security in continued high outputs, but also because the quality of the work is best with machines running at the highest speed.

In deciding the size of the machine equipment, or the size of a particular machine, regard should be paid first to the size and amount of work required to be produced. As a rule it does not pay to instal a machine beyond the size of the work, because both the costs on account of power and upkeep are made unduly high. And even if an increase in production is anticipated it is rather the better way to put down two machines.

When buying machinery of any kind, it is generally the course of wisdom for non-technical purchasers, with only a limited knowledge of engineering, to consult a third party who possesses this knowledge. We are, however, better placed in the woodworking industry. Our engineers (as far as the knowledge of the writer goes) are reliable. But a word of warning is necessary. Don't order a machine upon your own judgment alone unless you are quite sure—quite confident—your judgment will not be called into question later—perhaps by your foreman or the man who has to work the machine.

In buying machinery it is always advisable first to consult the operator (through his foreman), and then consult—not instruct the engineer. It is surprising what help—what knowledge that can subsequently be turned into hard cash—can be obtained freely of the engineer if you frankly state your requirements and repose some confidence in him.

Many proprietors of sawmill, joiners' shops, etc.—particularly medium or small plants—still prefer to plan their own machine layout. It is quite unnecessary to-day, and rather foolish to boot, because, whether a new mill is afoot, or the simplest addition to an existing plant, engineers prefer to lend their expert assistance. It is all a matter of business. Simply stated, the position is that it pays the engineer to make a fast friend of the sawmill proprietor, and, incidentally, the sawmill proprietor has everything to gain and nothing to lose by such business friendship.

My advice to leave the lay-out of the shop to the engineer will not, I know, be acceptable to all. And there is something to be said for the other view. There is a keen pleasure to be derived in laying out one's own shop, especially when the planner has a liking for organization.

A good way to proceed is to measure up the floor space available, and prepare a drawing set out $\frac{1}{4}$ -in. to the foot. It is highly important that this drawing be absolutely correct in the smallest detail, particularly in showing doors, windows, pillars, stairs, hoists, recesses, etc. The need for knowing the exact position of any of these items will soon be seen. Now measure up all machines, taking their overall dimensions, including the space required for the largest stock any particular machine will take. For instance, with the Log Band Saw take the extreme travel of the table both ways, plus an allowance for manipulating the log and cut boards. Draw a plan of each machine with these dimensions to the same scale as the mill plan, on thin cardboard. Cut the shape out, and put a pin through the centre. Now you can plan to your heart's content, moving the machine shapes

where you will, fixing them temporarily by means of the pins, until you have finally settled the arrangement. Then past them down on the mill plan.

In laying-out the machines, drives which run through floors must not be overlooked, and where machines are to be motor-driven, the latter, of course, must be added in proper relative position to the cut-out machine shape. Again, the crane must not be forgotten, and machines fed by it must be placed accordingly.

Another important factor arises in the arrangement of aisles. Ample provision should be made for the movement and conveyance of stock according to the extreme size of the latter likely to be at any time in any given position.

And finally, do not forget that the arrangement should provide for machines travelling straight forward, or directly around in a circular plan. What I mean is that no work should double on its track. Any work which returns and has to cover the same ground later for completing, is subjected thereby to lost motion, and lost motion means less profits. And when you have completed your plans, show them to your engineer, and ask him to revise them.

"Time is of the essence of the contract." This quotation is particularly apt considered in relation to the buying and selling of machinery. "Time" is the "bete noire" of the engineer. "So many chance occurrences crop up to delay delivery, and the buyer is so unreasonable," says the engineer; while the buyer makes retort, "You'll promise anything to get the order." As in most departments of life the truth lies in the via media. The engineer is naturally anxious to meet a prospective buyer's wishes in regard to delivery, and is frequently led to promise more than it is possible to fulfil.

There would be fewer disputes under this head, however, if the buyer stipulated for a definite delivery date, and not to be content with "about six weeks," or some such nebulous phrase. On the other hand, it is in the best interests of the buyer to be reasonable should the engineer desire a little longer than the contracted time. Accidents will happen, and it is not wise to rush the completion of a machine or plant. After all the standardization that has taken place in machine shops during the past ten years, the day of prompt deliveries seems as far off as ever.

The fact is that the amount of re-designing which has been done during the same period has barred out repetition work, and the making of standard machines to stock. By-the-way, is there such a thing as a "standard" woodworking machine? This question would form the subject of what should prove a highly instructive discussion. Except for the simplest operations—such as plain sawing, cross-cutting, etc.—it does not appear that strict standardization is to the interests of the machine woodworker. Of course, the engineer can "standardize" a frame, a spindle, a bearing, and similar details regularly required, of given dimensions. But to standardize a complete planer and matcher, for instance, as is being attempted to-day, and to refuse to deviate in the slightest particular to meet the special requirements of a woodworker who desires to meet competition in his own way, by, perhaps, an additional adjustment, or a slight alteration—such refusal is not to the interests of the woodworker, and the tendency should be resisted. Engineers have their labor troubles, and desire to lessen cost production, no doubt, but are not the woodworkers to have consideration "by the same token?" By which it will be seen that the astute buyer will observe whether his engineer is more concerned in selling direct from his catalogue than he is in the operations the buyer desires to perform.

How many machines are ordered without saws, cutters, or other necessary tools? The engineer's remarks on this "kink" would be interesting. The best machine, of course, cannot work without a tool of some kind, but by what process of reasoning a buyer lays out good money in, it may be, a first class machine, and then imagines any old tool will do—the workman must "make good"—is incomprehensible. A new machine installed under such conditions might quite conceivably do less work than the old. The operator may by long use have discovered the best way of getting the most out of the old machine, in humouring it, and if the new is not equipped with the tools the engineer intended, it is not to be expected that other than disappointment will ensue. Good tools, and plenty of them, are the stock of efficiency in any shop, and a number should always be ordered with the machine, because when so ordered they are tested in the machine by the engineer—at least in most cases. With a stock of good tools in the shop there need be no lengthy stoppage on their account. It is false economy to have any lack of good tools.

Reference has been made to the necessity of spare tool equipment, and it must not be overlooked that alongside this is the equal necessity for proper provision for grinding, sharpening, and setting. The old method—especially where new type machines are installed—is an anachronism, and its presence displays a lamentable lack of courage on the part of the person responsible—usually the office. What is the particular advantage of a high-speed machine if tools are prepared by machinemen in the old manner? How much more work is being turned out with the more expensive machine if it is standing one-half

the day? Either "go the whole hog," or stay in the rut. There is no half-way house—not for long. There are very few mills or shops in which the advent of a properly qualified saw sharpener and tool iron grinder would not be a profitable asset. And when installed, let him be responsible not only for keeping the saws and tools ready for use, but also for handing them out and recording them, so that it shall not be possible for tools to be stored away by machinemen who are bitten with the "dog in the manger" spirit. If there is a manager who is dissatisfied with the number and length of stoppages of the machines in his mill, and who is at the mercy of a system which permits of every machineman taking care of his own tools, let him try the method I advocate—let him instal a capable man, make him responsible, and provide him with the necessary apparatus (it is not expensive). Then let such manager note the increased output, and balance same against the expenditure incurred.—Timber.

Canada's Foreign Trade in Wood Products

Exports of forest products from Canada during the month of February, 1914, were valued at \$1,961,206 as compared with \$2,212,485 during February, 1913. For the eleven months ending with February the exports were valued at \$40,097,151, as compared with \$40,895,709 during the eleven months ending February, 1913.

The exports of forest products during February included the following:—pine deals, \$69,610; spruce and other deals, \$298,076; laths, \$57,093; planks and boards, \$742,953, of which \$629,430 was to the United States; shingles, \$574,476, of which \$553,148 was to the United States; pulpwood to the United States, \$535,931; wood pulp chemically prepared to the United States, \$240,437; wood pulp mechanically ground to the United States, \$174,298.

Imports of forest products coming into Canada free of duty, during February, 1914, were valued at \$788,711. For the eleven months ending February, the value under this heading was \$15,125,206. The imports of free forest products included the following:—hickory and oak spokes, \$18,936; fence posts and railroad ties, \$105,218; logs and round unmanufactured timber, \$19,768; mahogany, \$16,639; oak, \$155,035; pitch pine, \$119,408; white ash, \$17,065; planks, boards, etc., dressed on one side only, \$216,147.

National Hardwood Convention Programme

The 17th annual convention of the National Hardwood Lumber Association will be held in Buffalo on June 18th and 19th. The first day's programme includes the reports by officers and committees in the morning, and a special trip to Niagara Falls in the afternoon. On the second day, the report of the Inspection Rules Committee will be presented, an address will be delivered by A. E. Trefz, Field Secretary of the Chamber of Commerce, U.S.A., and election of officers and directors will take place. On Friday evening, June 19th, a complimentary banquet will be given at the Hotel Statler, which is to be headquarters for the convention.

Special Timbers for Aeroplanes

Toronto, May 4th—Editor Canada Lumberman:—We notice in the Canada Lumberman of April 15th an article entitled "The Commercial Importance of Spruce," by R. G. Lewis, and on page 37 there are a few sentences commending spruce for framework for aeroplanes. We have had enquiries for "silver spruce" for aeroplane construction from Australia. We see, for the article referred to, that spruce can be obtained in Canada for aeroplane construction. We would be much obliged to you if you could give us any further information regarding where we can obtain this spruce.—Imperial Export Company, Limited.

Mr. R. G. Lewis, the writer of the article referred to, reports in reply to the above question that "Silver Spruce" is not an accepted common name and it would be impossible to say just what species is referred. In New York State where the aeroplane industry is most important the wood used is about two-thirds native red spruce cut within New York State itself. This is the same species that is cut in our own Maritime Provinces (*Picea rubra*).

The "Struts" or "spreaders" are made from this red spruce from West Virginia or from Sitka spruce from Oregon. This is probably the spruce referred to by your correspondent as "Oregon Silver Spruce," although I have never heard of Sitka spruce under that name. Undoubtedly Sitka spruce is the best material for this purpose, as it can be obtained in larger dimensions than any of the other spruces, clear of defect and possessing the essential straight grain. This wood can be obtained from almost any of the Coast Mills in British Columbia, but would of course, have to be selected with great care, by one who understood the use to which it was to be put.

"The following firms in New York State manufacture aeroplanes or parts thereof:—American Aeroplane Supply House, Hempstead, N.Y., International Aeroplane Construction Company, Jamaica, N.Y., Beekman Sash, Door & Woodworking Company, New York, N.Y.

If any readers of the Canada Lumberman can furnish further information upon this subject, we will be pleased to forward it to the enquirers.

type of plant is in successful operation in Australia, South Africa, South America, Spain, etc., where charcoal is the only available cheap fuel.

One of the good points of the engine is the simplicity of the design and the accessibility of the parts. It is easy to start and to handle. The smaller sizes are started by hand, while engines over 30 h.p. are started by hand pump which injects the first or starting charge, which may be petrol or compressed air.

Canada Machinery Corporation Adds to Its Catalogue

The Canada Machinery Corporation, Galt, Ont., have issued two new bulletins, Nos. 303 and 504, which are to be added to their catalogue of woodworking tools. No. 303 is a heavy moulder, to work 10 in. or 12 in. wide and is mounted on a substantial base. It is heavy and substantial in all parts and capable of doing the finest work. At the same time it is extremely convenient in adjustment and can be set up for any job in minimum time. The company have paid particular attention to the feed in this machine and believe it has a stronger and more powerful feed than any other of its type. Special attention has also been given to guarding the machine wherever possible, to insure the safety of the operators.

No. 504 is a tenoner, single or double head, with or without copes or cut-off saw, designed for light and heavy tenoning, and taking stock 4 in. thick and 17 in. in width. The length of a single cut is $5\frac{3}{8}$ in., and of double cut, $8\frac{1}{2}$ in.

Modern Equipment in Donald Fraser & Sons Mills

The accompanying illustrations show some of the new equipment which has been installed by Donald Fraser & Sons, Limited, Cabano, P.Q., and Fredericton, N.B., in their various mills. One of the illustrations shows a Four-Saw Gang manufactured by Wm. Mershon & Company, Saginaw, Mich., standing in the shop, all complete and ready for shipment. The other illustration shows one of the Mershon Twin Saginaw Band Resaws. These mills are all provided with wheels 66-in. in diameter and they carry 8-in. saws. The twin band resaw in connection with the sawmill, is operated in the same manner as the Mershon single vertical resaw, which is so well known that it needs no description. The twin band resaw illustrated, is provided with the same feed works and means for shifting and locking the feed rolls in any desired position with reference to the saw blade. It is also possible, with very little effort to space the saws any distance apart. If the log mill is sawing 3 ft. deal, the rolls are spaced 3-in. apart and the saws 1-in. apart, and in this condition the 3-in. deal will be transformed into three 1-in. boards. If the next flitch that is dropped from the log mill is 6-in. thick, it may be sawn in any way desired. Thus, the rolls may be spread 6-in. apart and the saws, say 4-in. apart, and the result will be two 1-in. boards and one 4-in. plank; or, the rolls may be shifted to one side and the saws spaced 2-in. apart, and a 1-in. board, a 2-in. plank and a 3-in. deal be the result.

This twin band resaw, in short, can be manipulated in any man-

Mershon Four-saw Gang at Plant of Donald Fraser & Sons, Limited.

ner that is desired. The saw is made to spread 6-in., in which case, of course, one saw only need be used. Equipment of this class enables a manufacturer to combine maximum efficiency with extreme economy, through the use of saw blades that are thinner than standard.

Donald Fraser & Sons, Limited, in their various plants, have placed orders recently for two Mershon Twin Saginaw Band Resaws, and one Four-Saw Gang, similar to the one illustrated in the shop interior, and differing only from the Three-Saw Gang, illustrated in another part of this paper, in that it is comprised of four units rather than three. Previous to this they also purchased and installed a Seven-Foot Twin for canting or sawing their logs. Logs are canted on the large Twin and then delivered to the Four-Saw Gang. In their other mills the same results are practically obtained by the use of single and twin roller feed resaws. The machines are worked out in every detail, the Gangs and the Seven-Foot Twin being supplied with air cylinders for setting the saws to cut logs or flitches into any thickness of boards, plank or deal required.

The equipment described above is also illustrated and described in the new sawmill catalogue issued by Wm. B. Mershon & Company. This catalogue is intended for distribution among those who are interested in modern sawmill equipment. It may be had by writing to the company at Saginaw, Mich.

Personal Paragraphs

Mr. William Rutherford, of the William Rutherford Sons Company, Limited, and Mr. W. J. Sadler, of Sadler & Haworth, have been elected members of the executive committee of the Montreal branch of the Canadian Manufacturers' Association.

C. C. Muir, of Nanaimo, B.C., has taken over the general management of the Island Lumber Company, operating at Duncan, B.C., about half way between Victoria and Nanaimo. He was formerly secretary of the New Ladysmith Lumber Company, Nanaimo.

Mr. C. C. Mendham who has been connected with the outdoor staff in Toronto of the Herbert Morris Crane & Hoist Company, Limited, has now been appointed Resident Engineer in Berlin for the same company. This appointment is in line with the policy of the Herbert Morris Crane & Hoist Company which consists, not only in carrying large stocks of their manufactures to ensure prompt delivery, but in furnishing also a consulting engineering service for advising on the best equipment for any given set of conditions.

Wm. C. Purves, St. Stephen, N.B., formerly a well-known lumberman, of St. John, N.B., and also of Baring, Me., and Calais, Me., died at St. Stephen recently. At St. John, N.B., Mr. Purves was a member of the firm of Purves & Warner. About fifteen years ago he retired from the lumber business and conducted a very successful wholesale grocery and coal business at St. Stephen.

Mr. W. J. Foye, of the McShane Lumber Company, Omaha, Neb., visited Toronto recently on business. The McShane Lumber Company turn out about 150,000,000 feet annually and a good deal of their product finds its way into the Ontario markets. Mr. Foye reported that he had been pleased with his Ontario trip and that the company had recently secured some very fair business in this province.

Mershon Twin Saginaw Band Resaw at Plant of Donald Fraser & Sons, Limited.

A Lock Joint for Casement Sash

North Cobalt, Ont., Editor Canada Lumberman: I am sending you a sketch of a lock joint for casement sash, which may interest some of your readers. I have used these joints with great success and find that they work like gears. Only one cutter and one setting

of the machine are necessary, providing the cutter is well made. In operating the machine the face side of the sash is reversed alongside of the gauge of the buzz planer. If the cutter is well made, the joint will work free, like a set of gears and will not press the sides of the frame or jambs.—J. Joannis.

Filer's Diplomacy

An old filer, long experienced in the game, attributes much of his success to the fact that he always sought the co-operation of the sawyer. Young filers will do well to profit by this advice. Even if you know your business from A to Z, it will sometimes get you more to ask the sawyer what he thinks. He might suggest a slightly different shaped tooth, or a deeper gullet, and when you send him a saw prepared the way he suggested you can bet your last dollar that he will do all in his power to get results with that particular saw. In other words you have him working for you and with you instead of against you. I have seen instances where the filer and sawyer pulled against each other like a couple of Missouri mules. The sawyer "kicked" on every blade sent out to him; the filer intimated with loud accents that the sawyer was a "rube" and didn't know a good saw when he saw it. Co-operation between sawyer and filer will make the work of both lighter and easier, and the boss will be better satisfied and think more of both.

Canada's Imports and Exports of Wood Goods

An advance report of the trade of Canada for the twelve months ending February, 1914, shows that the exports of forest products were valued at \$42,456,502, as compared with \$43,125,791, in the corresponding period a year ago; \$31,339,637 in 1912, and \$35,959,530 in 1911. Imports of wood and manufacturers of wood from the United States were valued at \$24,354,020 and from Great Britain at \$635,168, making a total of \$25,601,277, as compared with \$27,557,307 for the twelve months ending February, 1913.

Exports of wood and manufacturers of wood were valued at \$33,570,483 to the United States and \$12,369,385 to Great Britain, a total of \$49,479,120, as compared with \$49,403,342 during the twelve months ending February, 1913.

Details of the exports of wood and manufacturers of wood are as follows:—

	Twelve months ending February			
	1913	Total	To United Kingdom	To United States
Wood and mfrs. of—Total	49,403,342	49,479,120	12,369,385	33,570,483
Logs	1,076,574	507,649	117,012	390,232
Lumber—Deals, pine	1,461,882	1,412,251	1,325,634	61,850
Deals, spruce and other.	5,584,805	6,646,020	6,047,436	517,836
Laths, palings and pickets.	1,977,649	1,932,030	2,024,060	1,878,375
Planks and boards	20,834,278	19,383,923	1,808,947	15,099,074
Shingles	1,380,316	1,579,362	292	1,542,312
Timber, square	1,306,971	580,998	554,771	12,741
Wood blocks for pulp	6,576,021	7,184,817	7,184,817
Wood pulp	5,428,541	6,203,264	1,229,992	4,674,145

Spanish River Co. Loses Appeal

A report from New York states that the Spanish River Pulp and Paper Mills, Limited, has been unsuccessful in their application before the United States Court of Customs Appeals for free entry of their ground wood pulp lumber under the reciprocity act. The question involved arose over the prohibition of export of Crown lands woods from the company's limits. This prohibition was in force when the company secured its limits, but was subsequently removed. Exports to the United States were, however, charged the full duty

upon entering that country. The Board of General Appraisers sustained the Spanish River Company's claim for free entry, but the Court of Customs Appeals has now reversed the decision, claiming that it would be an evasion of the United States law, which is designed to prevent restriction of every kind upon the export of pulpwood from Canada.

A Long Forestry Survey Trip

One of the longest journeys ever made in the interests of forestry surveys will be undertaken shortly by William J. Boyd, of the Faculty of Forestry, University of Toronto. The Dominion Government has placed him in charge of a party to ascertain the resources of an enormous area of practically unknown land lying partly within the Arctic Circle. Mr. Boyd will make his way northward from Edmonton two thousand miles to the Arctic Sea and will return in about two years by way of the Yukon River.

The Cost of Doing a Retail Business

There are three essential elements in any selling price—invoice cost, expense and profit—and the two latter only are partially within our own control, the invoice cost being altogether above and beyond our control.

It has been truly said, "The wastefulness of commerce is one of its weakest spots," and especially is this applicable to our business, in which there is not only waste through failure to analyze our cost of doing business, but also through multiplication of competition.

Profits may be conserved by waste prevention, efficiency, economy and lessening of competition, the latter being altogether beyond our control.

Cost is an every-day word, yet few of us really discern its true meaning.

Manufacturers usually analyze cost accounting more thoroughly than the dealers—too often we conduct our business on an assumed arbitrary cost and he who leads in our line must ascertain the truth as to the actual cost of conducting his business—the worst deceived man is he who deceives himself.

No business can be more secure in its fundamental permanency and soundness than that which supplies staple building material in a practically undeveloped country.

In our business we deal very largely in a staple commodity, the commercial value of which is generally recognized as fixed with reasonable certainty in all localities and seasons of the year.

What are the chief reasons for so many of us failing to realize any real or substantial results notwithstanding our application, earnestness and diligence?

Perhaps the first and most important reason is that in nearly every community there are too many dealers for the volume of business possible in that community, a fact which materially increases expenses and necessarily causes much economic waste through duplication of effort.

There are at least two other reasons for inadequate results—where they are inadequate—on investments in retail lumber yards, ignorance and inefficiency.

These two work hand in hand with loss and waste, and the successful merchant is he who wisely learns by thoroughly informing himself as to his business, its essentials, its limitations and its possibilities.

A few years ago "Efficiency" was the watchword commercially, and at the present time "Standardization" is offered as a panacea.

Standardization of methods of cost and profit accounting is rapidly becoming of interest to retail merchants, and we should standardize our methods in these important essentials, thus avoiding the realm of guess-work.

To insure a uniform, safe and standard basis for service in our business we could probably do no better than to utilize the rules recommended by the National Association of Credit Men.

As an illustration, let us assume an investment of:

In merchandise	\$10,000
In receivables	5,000
In R. E. and Imp.	5,000

Total \$20,000

1. Charge interest on the first two items (R. E. and Imp. not included) at the beginning of the business year. Interest at 8 per cent. on \$15,000 \$1,200
2. Charge rental on the real estate and improvements used in your business at a rate equal to what you should receive if renting to others, which is at least 10 per cent. of the fair and reasonable sales value. Annual rental of 10 per cent. on \$5,000 500
3. For your own services you should charge an amount equal to what your services would be worth to others; treat in like manner the services of any member of your family,

though such a one may not be on the regular pay-roll.

Salary of manager of yard	1,200
Salary of assistant	600
4. Charge depreciation on all goods carried over on which you may have to make a less price because of changes in style, damage through exposure to weather, culls, broken bundles etc.	150
5. Charge depreciation on wagons, teams, tools and all other fixtures, equipment, etc., subject to depreciation and wear which is usually computed at 10 per cent.—\$1,500 at 10 per cent.	150
6. Charge amounts donated or subscriptions paid, including advertising, publicity expenses, charity, etc.	120
7. Charge all fixed expenses, such as water, lights, insurance, interest, fuel, taxes, attorney fees, etc.	350
8. Charge all incidental expenses, such as drayage, postage, stationery, livery, telegrams, telephones	120
9. Charge all losses, such as goods stolen, rebates to customers, bad debts, etc.	250
Total	\$4,640

When you have ascertained what the sum of all the foregoing items amounts to, prove it by your books, and you will have the total expenses for the year, then divide this amount by your total sales, and you will have the per cent. of expenses.

In the above illustration on assumed annual sales of \$25,000 and an assumed expense of \$4,640, the per cent. of expense is 18.56.

A merchant who finds at the end of the year that his profits are inadequate sometimes assumes that an excessive expense account is the sole reason for an inadequate profit, when the trouble is often due more to his low selling price than to his expense account.

The subject of the correct method of calculating profits is an important one, and most essential, and there is a variance of opinion as to the correct method.

An incorrect understanding of the arithmetic of percentages and failure to observe the correct method of figuring the percentage of profit on the selling price instead of the cost has been the cause of many slim showings at inventory periods.

It is scientifically correct to base the margin of gross profit on the cost price, but it is most important to keep prominently in mind in doing so the difference between the cost and selling price.

A Puzzle in Percentage

If an article cost \$1.00 to manufacture and the expense of selling is 22 per cent. For what must it sell to yield a net profit of 10 per cent?

The superficial way of arriving at the answer would be to take the cost of \$1.00 and add 22 per cent., or 22 cents, and to the sum of \$1.22 add 10 per cent. profit, or 12 cents, giving \$1.34 as the selling price, but the answer is \$1.47.

In this case the expense percentage being 22, the expense is 22 per cent. of \$1.47, or 32 cents, instead of 22 cents.

This illustration shows us that if our percentage of expense on selling price, as in the example used of the yard selling \$25,000 per year is 18.56 per cent., then 18.56 per cent. added to the cost of goods will not cover the expense because we have used the selling price as the basis.

In one case we are figuring on the selling price and in the other case on the cost price.

The percentage of profit and the percentage of cost of doing business should both be figured on the same base.

It is a common error to add 25 per cent. to cost when 25 per cent. gross profit is wanted, and imagine that we are getting 25 per cent. gross profit on our sales when we are really getting 20 per cent..

The most important reasons why percentage of profit should be calculated on selling price are:

1. The sales totals are always readily ascertainable.
2. Gross cost generally can only be ascertained at the end of the year.
3. The amount of profit is generally figured on the volume of business or the aggregate sales as is also the percentage of expense.
4. Allowances to customers and salaries to salesmen are based on sales.

As an illustration of the self-deception often practiced in figuring profit entirely on cost, a transaction that recently came to notice may be used as an example.

In this case the yard manager had a gross profit (on cost) of 22.4 per cent.—the bill cost \$500 and was sold for \$612. As their expense account was 15 per cent. of their sales, the expense was \$91.80.

Cost of bill plus expense	\$591.80
Selling price	612.00

Net profit \$ 20.20
or 3.3 per cent. on selling price.

The yard used a printed list at which prices they figured all estimates and made a practice of quoting 10 per cent. discount for cash from estimates so figured.

Safeguarding the Jointer

The National Association of Manufacturers is taking a keen interest in protecting employees from injury, and is now issuing a "safety first" supplement to its publication, American Industries. In a recent issue the following appeared on "Safeguarding the Jointer"—an article that is of more than passing interest to men operating and employed in woodworking factories:

"While the circular saw is credited with causing more injuries than any other woodworking tool, this fact only remains true because of the great number of these machines in use, as the jointer is equally if not more dangerous, and the injuries inflicted, especially with the old type of machine, are usually of a more serious nature. Like the saw, the jointer is a very common and necessary tool in all shops where woodworking operations are done, and even with the most experienced operators, and the best type of safeguards, the work cannot be considered safe. This is true because of the close proximity of the operator's hands to the rapidly revolving knives, also the fact that the safety of the operator rests wholly on the hands for controlling and manipulating the work. As the stock is pushed over the knives, some pressure must be exerted to keep it in place, and to insure satisfactory work, which always brings the hands directly over the gap in the tables and very near the danger point. This requires a careful operator, one whose mind is always centered on his work, and who thoroughly understands the setting and operating of the machine.

"There have been many guards devised to improve the safety of this hazardous machine, but the one that will do more to prevent accidents or decrease their severity is the safety cylinder. With the old square head type the opening between the tables and knives is very much greater than with the circular head and once the fingers are struck by the knives they are pulled further in and the major portion of the hand is usually mangled. The circular head on the contrary fills the opening so that there is no space left for the fingers, and the injury, except in very rare cases, does not result in more than clipping the finger ends. Another feature of the circular head is when the back table is set too low or when short pieces are being run, the knives have a tendency to cause the work to tip and throw the hand into the cutter head.

"The circular head does not complete the guarding of the jointer, as it is also advisable to place a guard, either automatic or adjustable, over the knives, as a further step toward safety. There is a large variety of such guards manufactured, having more or less merit, which can be used on many classes of work, while in some cases even the best of them are impracticable and the circular head is the only guard available. Such a guard has another feature in keeping the portion of the knives covered that is not in use, thereby preventing one unknowingly placing the hand in a position that may cause injury. When the edge of the stock is being jointed there is no need to keep the entire length of the knives exposed, as instances often occur of a workman passing a machine and laying his hand over the knife, or the operator slipping and the fingers being thrown into the knives.

"A frequent cause of jointer accidents is due to the operator attempting to plane a piece that is too short to be held with safety, which results in its tipping or kicking back, throwing the hand into the cutter head. In Germany among woodworking associations it is a rule not to permit pieces shorter than 15¾ inches to be jointed on a hand planer unless special precautions are taken to hold the material.

"While it is difficult to set a minimum length, it is always advisable to use a push block or other holding device, should there be any possibility of an accident resulting because of short material. Where there is a large amount of short work to be done, a self-feeding attachment will aid materially in eliminating accidents from this source. With such arrangements it is only necessary for the operator to push the material to a point where it will be carried to the knives by the means of rollers, spurs or fingers, thereby not requiring him to place his fingers in a dangerous zone.

"One that is familiar with woodworking operations has often noticed the slippery condition of floors around saws, shapers, jointers, and other woodworking machines and can readily understand what the result may be should an operator slip or fall while working in their vicinity. Because of the hazards connected with jointer work such a floor condition should not be permitted to exist and the danger removed by placing a rubber mat, old belting or other non-slipping material on that portion of the floor utilized by the operator."

The 17th annual convention of the National Hardwood Lumber Association will be held at Buffalo on June 18th and 19th.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS,
Hamilton, Ont. 7-12

Wanted

30 ft. White Pine and Spruce piles for immediate delivery or during the summer at the rate of one or two cars per week. Box 20, Canada Lumberman, Toronto. 10

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
Board of Trade Building,
Montreal, Que. 9-tf

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8-ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

Wanted to Buy

250,000 ft. 4/4 No. 1 C. & B. Basswood, winter sawed.
Ten cars 4/4 x 12-in. and up Soft Elm.
One car 4/4, 6/4 and 8/4 1s and 2s Soft Elm.
Box 998, Canada Lumberman, Toronto 7-10

For Sale-Machinery

For Sale

Twenty-three ton Manhattan Yard Locomotive, ten cars and rails. Apply to,
E. R. C. CLARKSON & SONS,
15 Wellington Street West,
Toronto, Ont. 10

WOODWORKING MACHINERY FOR SALE: 1 MacGregor-Gourlay power feed rip saw; 1 No. 51 Crescent universal woodworker; 5 30-in. Ideal pedestal bandsaws; 1 24-in. Ideal planer, matcher and moulder; 1 No. 1 Ballantine power feed dowel machine; 1 8-in. three side moulder; 2 6 1/2-ft. iron frame swing saws. H. W. Petrie, Limited, Toronto. 10

Second Hand Machinery

150 to 175 h.p. Corliss Engine, 16-in. x 36-in., new two years ago.
75 to 100 h.p. Brown Automatic, 13-in. x 30-in., in excellent condition.
500 to 750 h.p. Buckeye; a good sawmill engine.
Boilers, 72-in. x 18-ft. and 54-in. x 14-ft.

THOMAS HOBBS,
Mail Building,
Toronto, Ont. 7-tf

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Position wanted as sawyer. Circular. single or double cut band saw. Box 306, Parry Sound, Ont. 8-10

Single cut band or circular sawyer open for engagement. Best references. W. Gariefny, Box 49, Chandler, Gaspé Co., Que. 9-10

Position wanted by experienced manager in good lumber or lumber manufacturing concern in Canada. Thoroughly up-to-date in wholesale or retail end. Robert Wells, Winchester, Ont. 10

COST CLERK desires position with a woodworking concern. Ability to organize. Practical and experienced. Best of references. Box 990, Canada Lumberman, Toronto. 9-10

Saw filer, band or circular, wants position. 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 9-12

Young man desires position. Eight years' experience in Montreal retail lumber business. Speaks both languages. Can take charge of retail yard, or will travel in any part of the Dominion on salary or commission. Box 24, Canada Lumberman, Toronto. 10

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Lumber Traveller for Ontario. Would prefer young man with experience. Reply confidential. Box 5, Canada Lumberman, Toronto. 8-11

Wanted at once for saw mill: One filer for circular saws, two setters, two doggers, two edger men, one trimmer, twenty-five general hands.

Devon Lumber Company, Limited,
Pine, Ont. 10

WANTED—Salesman calling on the lumber trade and contractors in the Eastern Provinces, to handle Dr. J. M. Stewart's Veterinary Remedies as side line.

Palmer Medical Company, Ltd.,
Windsor, Ont. 10-tf

Business Chances

Wanted

A thoroughly practical man with some capital to invest, capable of taking entire charge of sawmill and logging operations with a well established and successful firm owning limits containing 12 years' cut. Have a cut of three million this year. An exceptional opportunity for the right man. Owners wish to retire from active part of this end of the business. Write Box 18, Canada Lumberman and Woodworker, Toronto, Ont. 10-11

Business Opportunity

For Sale—Woodworking shop fitted especially for general work. New and up-to-date machinery. First class dry kiln. Blower system. Railway siding. Situated in a live and thriving Ontario town. Splendid local and shipping trade. This is an exceptional opportunity to acquire a good business with a trade already established.

Write J. A. C., Canada Lumberman, Toronto. 10-12

British Columbia Saw Mill and Timber Limit For Sale

A 25-thousand feet capacity Saw Mill, and 90 million feet first class Spruce, Red Cedar, Hemlock and Yellow Cedar, etc., under B.C. Special License. At good shipping point near Prince Rupert, B.C. Inspection invited. A. Cuthbert, P. O. Box 456, Prince Rupert, B.C. 6-11

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. t.f

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-tf

For Sale

Complete sawmill outfit, practically new; capacity 12 M. ft. hardwood. Marine boiler, 50 h.p., and Dutch oven. 40 h.p. engine. No. 4 carriage with overset lever. Cable feed. Friction canter. Double edger; cut off saw and a full complement of large and small saws and belting, including a 14-inch 2-ply leather driving belt. Frame building, iron roof.

Also Long Mfg. Co. Clipper Shingle Machine in best of condition, and outfit complete; will be sold with sawmill or separate. Mill at Angus, Ontario. Apply Frank McMullin, Barrie, Ont., who will show mill, or Chas. T. DePuy, Rochester, N.Y. 8-10

Timber Sale

Tenders will be received by the undersigned up to noon of the 8th day of July, 1914, for the right to cut the Red and White Pine timber on Berths 1 B, 1 C, and 1 D, in the Mississauga Forest Reserve tributary to the north shore of Lake Huron, each Berth containing an area of 36 square miles, more or less.

For maps and conditions of sale apply to the undersigned or the Crown Timber Agents at Thessalon, Sault Ste. Marie, Webbwood and Sudbury.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Toronto, April 18th, 1914.

N.B.—No unauthorized publication of this notice will be paid for. 9-18

Tenders for Wood Limit

Tenders will be received by the undersigned up to and including Monday, the 8th day of June, 1914, for the right to cut wood of various descriptions on a certain area tributary to the Frederickhouse and Abitibi Rivers in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the ordinary Crown dues, including 40c per cord for spruce and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council for the right to operate wood products mills on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory, and to manufacture the wood into products thereof in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, Ont., April 24th, 1914. 10-11

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

**Timber Sale**

Tenders will be received by the undersigned up to noon of the 15th day of July, 1914, for the right to cut the Red and White Pine timber on berths 1, 2 and 3, Township of Blyth, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned, or the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,

Minister of Lands, Forests and Mines. Toronto, May 4th, 1914.

N.B. No unauthorized publication of this notice will be paid for. 10-13

**Sale of Pine Timber on Metagam Indian Reserve**

Tenders will be received by the undersigned up to and including the 6th day of July next for the right to cut the Red, White and Jack Pine timber over eight inches in diameter on the Metagam Indian Reserve, situate on the Metagam River in the District of Sudbury. For particulars, descriptions, conditions, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines. Department of Lands, Forests and Mines, Toronto, May 2nd, 1914.

No unauthorized publication of this notice will be paid for.

**Tenders for Allan Water River Wood Limit**

Tenders will be received by the undersigned up to and including Wednesday, the 15th of July next for the right to cut ties from Spruce, Balsam, Banksian or Jack Pine, Poplar and Whitewood trees seven inches and upwards in diameter two feet from the ground sufficient to supply a tie preserving plant for a period of twenty-one years from unoccupied, unsold and unlocated lands of the Crown tributary to what is known as the Allan Water River, tributary to the Grand Trunk Pacific Railway in the District of Thunder Bay.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of \$2 per thousand feet board measure for anything not manufactured into ties, and for ties at the rate of 5c each, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council.

Such tenderers shall be required to erect within the limits of the territory covered by the right to cut ties, or at some other place approved by the Lieutenant-Governor in Council a tie preserving plant.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for \$25,000, to remain on deposit as security for the carrying out of the conditions of their tender.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines. Toronto, Ont., April 27th, 1914. 10-13

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

For Sale

Modern, up-to-date Band Sawmill, new Waterous machinery, capacity 65,000 ft. per day. Apply to

E. R. C. CLARKSON & SONS,

15 Wellington Street West, Toronto, Ont.

**Saw Mill Machinery For Sale**

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood. The Waterous Engine Works Company, 22-t.f. Brantford, Canada.

Yellow Pine Grading

A proposed change in the methods of grading yellow pine was brought up in a favorable report recently presented by the committee on grades at a meeting of the Yellow Pine Manufacturers' Association in Chicago. While not a new principle, the method proposed, which is to judge the grade of the timber by the number of annual rings to the inch, is of great importance to the lumbering industry and also to the consumer of lumber.

The ring rule is not a new thing as applied to pine timbers. Its principle is well understood. It is based on the number of rings of yearly growth per inch on a line measured from the tree's heart to the bark.

There are four leading southern yellow pines, commonly called longleaf, shortleaf, loblolly, and Cuban. The first of these is usually of slow growth, with narrow rings. It is known commercially as hard or Georgia pine, and possesses great strength when the timber is of slow growth. The other three pines usually grow more rapidly, with wider rings; but any of the pines may grow slowly or rapidly.

The proposed ring rule does not favor or disparage any particular species of southern yellow pine, but is concerned only with the width of the growth rings. This is on the assumption that timbers with rings of the same kind are of the same strength without regard to the exact species. In connection with the number of rings to the inch, their character is likewise considered, with regard to the proportion of the ring composed of dense summerwood and of light springwood. The proposed rule has been

favoured because of its simplicity, and especially because it would remove a fruitful source of disputes and misunderstandings.

The Forest Products Laboratory at Madison, Wis., paved the way for the adoption of such a rule by making numerous tests of pine beams to ascertain their strength in relation to the width of the rings and the comparative quantities of springwood and summerwood. The tendency of the tests all pointed one way, and showed that so far as the southern yellow pines are concerned, strength is not a matter of species but of structure; and that two trees with similar rings do not differ much in strength.

"On a ring rule system of grading, timbers would be classed as "dense wood" and "not dense wood." A somewhat explicit definition of what dense wood is would necessarily form an important paragraph in the grading rules. The definition which the committee had before it at the meeting on May 5 was as follows:

Dense wood shows on cross section an average of not less than eight growth rings per inch, measured over the third, fourth and fifth inches, on a radial line from pith to circumference, containing in the greater number of rings one-quarter or more of summerwood; or it may have an average of six or seven rings as above,

provided that, in the greater number of rings, one-third or more of the ring is summerwood; or wider ring material if in the greater number of rings, one-half or more of the ring is summerwood as above; and the ring must show a sharp contrast in color between springwood and summerwood.

Review of Current Trade Conditions

Ontario

There is still nothing new of importance to report in connection with trade conditions in Ontario. With the arrival of warmer weather there has been some expansion in the volume of trade, but, generally speaking, wholesalers and retailers report that trade is exceptionally quiet. This seems to apply fairly generally throughout the country districts. In the large cities, building operations are a little more active, but are still much less than normal. In Toronto, some apprehension is felt on account of the threatened strike of the bricklayers, which would hold back building operations and postpone lumber purchases to a considerable extent. Travellers who have been covering Ontario points recently, continue to report extensive imports of yellow pine and American hemlock.

The demand for lath is good and stocks are very scarce with the result that prices continue stiff. No change is reported in the shingle situation and the demand is quiet.

Various reports have been received from Northern Ontario in regard to the results of this year's log drives. On the whole the reports show that the situation has improved during the past fortnight. A good deal of anxiety was felt recently on account of the low water prevailing at most low water points, which threatened to hang up many of the drives. During the past fortnight the weather has been more favorable. There has been a fair amount of rain, widely distributed and many of the doubtful drives have made good progress. The situation however, is not yet as reassuring as many operators would like. There is still a possibility that drives in some quarters which have a long distance to travel, or which commence in small creeks and shallow waters will meet with considerable difficulty.

The Ottawa River has been entirely cleared of ice by the recent warm weather. All the mills were operating by the first week in May. Trade is now fairly active and is expected to improve, although money is tight and building operations are curtailed to some extent. The export business to the Old Country is still very quiet on account largely of the important political problems which are disturbing trade.

Eastern Canada

Steady business continues at Montreal, but there is no rush of orders. Prices show no changes, but it is expected that an upward tendency will develop in the near future. Building permits for the first four months of the year show a falling off, but there were indications of a number of large buildings soon making a change in this condition. Log driving conditions in the St. Maurice River districts have been unfavorable on account of the absence of rain. Trade with Great Britain is practically at a standstill, although a fair quantity of birch timber has gone forward. Stocks of pine in Great Britain are heavy. The ground wood market shows no change. Low water conditions in Canada and the United States are expected to advance the prices for ground wood.

Conditions in the lumber trade in New Brunswick have shown some improvement during the past fortnight. The demand for lumber, however, is much below what it should be at this season. The spring weather has been exceptionally backward and a result is that building operations were delayed considerably. This has now been altered, a fair quantity of building is in progress, causing an improved demand for factory stock.

All the saw mills at St. John had started operations by the middle of the first week in May, with the exception of two which were waiting for logs. The mills sawing for the English market have sold their season's output at good prices. Those which are sawing for the American market have not been so successful, as it is hard to find buyers at any price. Practically all deals for the English market were sold at about \$17 per thousand for specifications of 50 per cent. 7-in. and 8-in. x 3-in. and 50 per cent. 9-in. and up, while scantlings and 4th quality brought \$2 per thousand less. These prices are all on sellers' wharves at St. John.

Merchantable spruce boards continue firm at \$16, but stocks offering are light. Narrow scantlings are in only moderate demand in the American market. City sawn, 2 x 3-in. and 2 x 4-in. are bringing about \$15 to \$15.50. Bank logs are commencing to come forward and are selling at about \$14 per thousand for deal logs and \$9.50 to \$10 per thousand for battens. Driving conditions have been unfavorable up to date and practically no driving had been done up to the first week in May. The drive on the upper St. John only commenced about May 4th and then encountered cold weather and lack of rain. Laths are

selling about \$3 on the wharf at St. John and stocks are very low. Only a fair trade is reported in box shooks.

The demand for dimension spruce at Boston does not show much improvement and it is thought that when more of the mills are marketing their output, prices may be more difficult to maintain than at present. Recent reports also tell of difficulty in making collections. The general base price for frames continues at \$25, and where there is no doubt about delivery, sales are made at \$24.50. Random is firmer than usual, some merchants asking \$23 for 2/4-in. There is a good demand for 2/8-in. at \$23. Spruce covering boards are less active, sales having been made recently at \$21.50. The usual price, however, is about 50c or \$1 more. No. 2 matched spruce boards are steady at \$24.50 to \$25. At New York the market for eastern spruce shows no important change. Prices of hemlock boards at Boston are a little firmer, good eastern clipped boards selling at \$24 more easily than they did a fortnight ago. The lath market at Boston is perhaps a little easier than it was a fortnight ago and \$4.20 for 1 5/8-in. and \$3.85 for 1 1/2-in. are probably representative quotations. Shingle prices are weak and the demand shows no improvement. White cedar extras of excellent quality are offering as low as \$3.50 and \$3.60 with collections at \$3 to \$3.20 and second clears at \$2.75 to \$2.90. Red cedar extras are bringing \$3.38 to \$3.75, according to quality.

Great Britain

Quiet business continues at London, but latest reports state that indications of improvement are noticeable. Shippers are holding out rather firmly with the expectation that the demand will improve in the near future. Prices at London show very little change. At Foy Morgan and Company's recent auction sale 3rd Quebec spruce, 3 x 11-in. was sold at £11 5s., 2nd Quebec spruce, 3 x 9-in. brought £12, and 2nd Montreal spruce brought £11 15s. For 3rd Montreal spruce £11 5s. was paid. Some of the other prices were as follows:—3rd Quebec 14 ft., at £11 5s., 4th Quebec at £10 10s., 5th Quebec at £9 10s., 3 x 7-in. 2nd Quebec at £10 5s. and 3rds at £9 10s.

No change is reported in the spruce deal c.i.f. market at Liverpool. A fair amount of business is in progress and shippers of the better class of deals are showing no inclination to part with their stocks unless good prices are secured. There is a feeling that better values will be obtainable when the market is a little more settled.

The Timber Trades Journal in its issue of April 25th says:—"It will take some time for the spot market to fall into line when the cargoes come along, and we feel confident that shippers and importers realize this. For instance, take the Liverpool ex quay market price for liner parcels to-day. These are very much below what importers can sell their cargoes at even to get cost price. Spruce has been sold for this port for later shipment, and we are given to understand that importers have paid shillings more per standard c.i.f. than they are selling to-day ex quay, so that in the ordinary course of events prices "to arrive" will more than probably be 20s. per standard over present quotations. Of course, it must be remembered that the quality and specifications of the cargo deals for Liverpool will be superior to those now being offered; but the fact remains that importers do not consider that they have paid more than the value, and it is for consumers to realize this and make the most of their opportunities at present.

"Manchester has not been affected to anything like the extent that Liverpool has with these consignment parcels, so that it is possible to offer Liverpool deals to arrive at somewhere about current quotations for Halifax deals now on the quay; but at the same time it would be as well for consumers to note that Miramichi, or equal, will be more than the usual difference, and we shall not be at all surprised if this is more marked as the season progresses. The actual spot business for the time being is not too encouraging, but the prospects are better, and it is expected that a sudden revival will take place shortly, as consumers generally are working off their high-priced stocks before making new purchases."

United States

The lumber trade in the United States is doing fairly well, if one compares it with other branches of trade, but that is about the most that can be said for it. With the advance of the season, the demand is increasing gradually and an apparent gain is noticeable throughout the country. The spring building campaign is widening, and as stocks generally were low in retail yards, it has been necessary for retailers to make sufficient purchases to meet the current demand for consumption. Similar conditions prevail in the furniture and other large consuming industries.

The principal difficulty in the lumber market to-day is caused by

B. P. BOLE, Pres. F. H. GOFF, Vice-Pres. E. C. BARRE, Gen. Mgr. W. A. SAURWEIN, Ass't. Mgr.

Cleveland-Sarnia Sawmills Co., Limited

BEAR IN MIND

That we saw the year round and always have large stocks of

Norway and White
== Pine Lumber ==

Large timbers cut to order, any length up to 60 feet, from Pine and B.C. Fir.

Headquarters for Norway Silo Stock.

the absence of large orders from railroads, carshops and extensive consuming industries. Large business interests are governed so much by the uncertainty in the general business situation that they are still trimming their sails closely. The country is still waiting anxiously for the decision of the Interstate Commerce Commission in regard to freight rate advances, as it is felt that with this question settled either one way or the other, the policy of the railroads in regard to purchases of stock will be definitely determined.

Gradual improvement is reported in the northern pine trade. Factories and other large consumers are showing an increased demand and, the building activity in the smaller towns is helping the retail trade. Good lumber is more plentiful than last year, but prices are firmly held. Stocks of low grade lumber are light. The hemlock situation shows improvement. Wisconsin prices have continued firm for the past two months. The demand in the Saginaw Valley shows

improvement and prices are about \$2 less than a year ago. It is reported that there will be a large production of hemlock bark in the upper Michigan Peninsula. Improvement is reported in connection with eastern spruce, the demand being heavier and prices firmer. West Virginia manufacturers are expecting better prices for spruce as the season advances.

The hardwood trade continues unaltered. Exceptionally heavy rain falls during the past fortnight delayed work in the woods in many districts throughout the south, with the result that a curtailment of the output is likely. Among the southern hardwoods quartered oak continues in good demand. Plain oak is steady and poplar is quiet. There is a good trade in ash, an improvement is reported in black walnut. Stocks of northern hardwoods are light and the market is firm. The demand for maple flooring is good and prices are stiff. There is a fair demand for birch, maple, elm and basswood.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Improvement in St. John Trade

St. John, N.B., May 5th (Special to the Canada Lumberman): Locally, conditions have changed for the better during the past month, but the demand for lumber is far from what it should be at this time of year, one of the reasons of course, being that the spring is very slow in warming up and the frost is really not yet out of the ground in some places.

A fair amount of house building is promised for the coming season throughout the city and in some cases the foundations are now being put down. This has started a certain demand for factory stock, for which the demand has been very small during the entire winter. Prices for all house joiners supplies are not quite so high as was anticipated, as the amount of work being limited, the manufacturers and factory men are cutting prices to some extent in order to capture the work. Schedules are being sawn out at about the same prices as last year.

All the sawmills are now running with the exception of Sayre & Company and Hilyard Bros., who may start later when logs come to hand. Messrs. Stetson Cutler & Company are sawing for the American market, the balance of the mills are sawing English deals. The mills sawing for the English market may have somewhat the best of it this season, as they have all sold their season's output at good prices, while the mills sawing for the American market have not been able to dispose of their cuts at any prices which would leave a profit. In fact, it is very hard to find buyers at any price. No change in the price of English deals will be felt by the manufacturers here as they are really out of the market, about all deals were sold at about \$17.00 per M. for 50 per cent. 7 and 8-in. x 3-in., 50 per cent. 9-in. and up, with the scantlings and fourth quality \$2.00 per M. less. All on sellers' wharves here.

J. E. Moore & Company now have a steamer loading for the English market and Geo. McKean also has another, which is taking largely stock from the interior mills, which has been cut during the past winter. This stock should have been shipped by the last liners, but the spring being so backward, and the rivers not opening, compelled the buyers to make special charters for this stock.

Prices for merchantable spruce boards remain firm at \$16, but very few are being offered, having been purchased earlier for the season's cut of mills. Narrow scantlings are not bringing quite so good a price as last season, owing to the shortage in local building, low prices and poor demand in the American market. For city sawn 2 x 3-in., 2 x 4-in. about \$15 to \$15.50 can be had. 2 x 6-in. bringing about same prices. Rotary sawn, country stock of sawn sizes can be purchased on cars for about \$14 per M.

Bank logs are now beginning to come forward and are bringing about \$14 per M. for deal logs, with battens at from \$9.50 to \$10 per M. Practically no driving has been done as yet. Many of the lakes are still solid and very little rain has fallen as yet. On the upper St. John they have just begun to drive, but are not getting on very fast owing to cold weather and no rain. Very few logs have yet come into springhill and prices have not yet been made for these logs, but as a rule, they sell for about \$1.00 per M. higher than in St. John.

Messrs. Riddle Robbins Lumber Company which built a mill last year at Hatfields Point on the Belisle will not operate this year on account of some litigation now pending between the partners or stock holders of the concern. It is to be hoped that everything will be adjusted so that the mill will be operated again in the near future.

H. W. Woods, it is said, will not operate his mill on the Nerepis.

The Wilson Box Company have rebuilt their mill at Westfield, and now have a very up-to-date plant.

The mill at upper Pagetown, operated lately by the Warren Company, will not be run during this season owing to the death of the owner. The mill is now being offered for sale by L. G. Crosley of St. John, who has been a part owner in the past.

At Fredericton, the mills of the York and Sunbury Milling Company and W. D. Gunter are now in operation with logs enough to carry them through the season.

Four cargoes of hard pine have arrived here during the past week from the south, consigned to J. A. Likely. They are now being unloaded and stored in his yards at St. John east. Freight from the south are about \$2.00 per M. less than last year. Where \$9.50 was the going rate last year, only \$7.50 to \$7.75 can be had this season.

Thos. Bell & Company are supplying the hard pine for the new docks at West St. John, the price is said to be about \$24.50 delivered St. John.

Laths are bringing about \$3.00 on wharf, at St. John with stock very low, and very few will be ready for some time to come, no old laths are now on hand.

The trade in box shooks is only fair, as fish are scarce, and it is not expected that trade will improve until later in the season. The demand for onion crate shooks from Bermuda has been very brisk some 100 M. shooks having been shipped from here during the past six weeks, but that trade has now been supplied for the year, and much depends on the crop next season, whether the demand will be as good. Another feature is that the Texan's are now raising onions which are taking the place of Bermuda's and are making their shooks right in their own neighborhood, this will no doubt be felt here by next season.

Coastwise freights are very low to New York, vessels finding it very hard to secure cargoes, taking charters if possible to find them at \$2.75 to \$3.00 per M. No freights for South American can be found, as the lumber trade is practically demoralized in that quarter, and no hopes are held for any market this year.

Ottawa Mills in Full Swing

Ottawa, May 7 (Special to the Canada Lumberman): The recent spell of warm weather has cleared the rivers throughout the Ottawa district of ice, and operations in the sawmills are now being carried on in full swing. Trade is fair, with prospects of improvement. Money is still tight, and consequently, building operations are being curtailed to some extent. Navigation is now open all through the country and a movement in the export trade is looked for. Business is not good in England just now, due principally, it is said, to the uncertainty of the outcome of the several problems of general interest now before the British Parliament.

The McAuliffe Davis Lumber Company, who recently built a large new sawmill and factory on Chamberlain Avenue, to replace the building destroyed by fire last fall are now operating the new plant with 50 hands working full time. The Duke Street mill is now being enlarged to double its present size, at a cost of about \$25,000. When the addition is completed the mill will measure 100 x 200 feet. The machinery for the mill will be installed some time this month. A large new rig saw, made by the Berlin Machine Works, Limited, of Hamilton, Ont., one of the largest rig saws in the country, was laid down a few days ago.

Considerable interest has been aroused in lumber circles since Senator Edwards, head of the firm of W. C. Edwards Lumber Company, Georgian Bay Canal. His objection was made, he said, on the ground

SATISFACTION FOR SALE

OUR Lumber is manufactured with a Purpose. From the Stump to the Finished Product this Purpose is never forgotten. We aim to make our Products and Satisfaction synonymous. We want every car we ship to be filled not only with Lumber but with Satisfaction.

We are equipped to give you uniform grades—dry stock—fine planing mill work—good service and courteous treatment.

When buying of us, your worry, your anxiety, is over with the placing of the order. You know you will get what you want—in the way you want it—that upon arrival, you will be pleased. It will make your business a source of pleasure and happiness.

that its construction would be beneficial to lumbermen and paper manufacturers only. In future the chief industry on the Ottawa River would be pulp and paper manufacturing, he maintained, and raw material could be handled better by large boats than by boom hauling. The canal would cost \$150,000,000 to build, an expenditure which could not be justified, unless the whole public should benefit.

Senator Edwards' application for authority to sell some of the surplus power he is developing at his plant on the Little Chaudiere Falls was passed by the Private Bills Committee last week, after the bill had been amended to compel the power to be sold subject to rates fixed by the Hydro-Electric Commission of Ontario.

Montreal Market Quiet but Steady

Montreal, May 8th (Special to the Canada Lumberman): The market continues in a fairly satisfactory condition. There is no rush of orders, business being steady. Prices are about the same, and the tendency should be in an upward direction. The official returns of the building permits for the first four months of the year were not encouraging, showing a total of \$4,061,166, as against \$5,190,213 in the corresponding period in 1913. The valuation for April was \$2,205,970 compared with \$3,322,406 in April of last year. Since the figures were issued, the decrease up to the end of last month has been more than made up, by permits for some very large buildings. The early falling off in values was due mainly to the increase in residences and flats and to the comparative activity of office building projects.

Reports from the St. Maurice River districts state that log-driving conditions are unfavorable owing to the absence of rain and the consequent lowness of the stream.

Export business to Great Britain is almost at a standstill, and it is pretty certain that the season's shipments will not come up to those of 1913. Messrs. Watson and Todd, the largest exporters from the port, have not shipped a stick, while one or two of the other firms interested in pine have sent only a few carloads. A fair quantity of birch timber has gone, together with a small quantity of sawn birch. There is a large stock of pine on the other side, while the demand for birch is by no means brisk.

Several tenders for the estate of the late Mr. J. H. Redfern were received by the Montreal Trust, the executors, but owing to the low prices offered, it has been decided not to accept any of the bids.

There is little variation in the ground wood market. As far as can be seen, the water conditions both in the United States and in Canada will be very poor, with a consequent diminution in the production of the pulp. This is favorable to a rise in values, especially as the United States will in a short time be compelled to come to the Canadian market.

Sulphite is in good demand, but prices have not materially changed.

The newsprint situation is strong, owing to the extra demands on account of the Mexican trouble. The Laurentide Company have sold the balance of this year's production.

Norwegian Wood Pulp Depressed

The Dominion Trade & Commerce reports in a recent issue contained the following reference to the Norwegian wood pulp market, from a Norwegian trade paper dated March 14th: "In spite of the fact that the statistical position of mechanical wood pulp is a good one, in so far that the Norwegian and Swedish makers have already disposed of the greater part of the calculated production of the current year, the market remains in a depressed condition and quotations are more or less nominal. About 4,000 tons mechanical have lately been sold to France at prices which leave not quite \$8.80 f.o.b., agency commission included. This week inquiries have been made for sulphite cellulose from different countries, including France and United Kingdom. While the European papermakers are generally making so low bids that the sellers are unable to accept the same, America has again bought at prices which the producers consider under present conditions satisfactory. 'Kraft' sulphate continues firm."

The same paper in its March 28th edition says:—"Mechanical wood pulp remains neglected, and the value is declining; at least one sale has been reported at \$8.33 including agency commission. Sulphite cellulose is depressed, although some moderate quantities have been sold this and last week to the States at current prices. Sulphate cellulose is firm but quiet."

Another Norwegian trade paper writes in a recent number as follows:—"With reference to the Scandinavian wood pulp market, it was believed that the very cold period during last winter would create a shortage of water, which would have influence on the prices to make them firmer. The exporters, however, are not convinced of this. There has not, on account of the stocks in the import harbours abroad, been an opportunity to strengthen the prices for the year. On the contrary it seems that the buyers have become still more careful, since they have found out that several new mills are building both in Nor-

way and Sweden. Easy bleaching sulphate, f.i. of the best known marks has been sold at £9 for delivery in 1915. Certainly the stocks in the export harbours are small, and when the shipments commence, the several new mills, which will be ready in 1914 and the following year, no doubt will create a strong competition."

Canadian Stocks in the Old Country

"The majority of the Canadian shippers who make an annual visit each winter to this country have now returned home," says the Timber Trades Journal, London, England, "and though perhaps they have not had reason to congratulate themselves on the net result of their endeavours, they have the satisfaction of knowing that things might have been much worse. Owing to various causes, prices have not been so satisfactory, but manufacturers have made a good clearance of their stocks. The upper qualities of pine deals have been disposed of very well (at reduced prices, however, on last year's figures), and stocks in the Ottawa district being light, buyers on this side should be able to do well with their purchases."

"No doubt it would surprise the man in the street to hear that Ulster's troubles are having their effect on Canadian spruce, but the fact remains, nevertheless, that Belfast merchants, who are large buyers of this material, are fighting shy of purchasing except from hand to mouth, and until the political position is more settled in that quarter, the spruce market will not find relief there. Allowing for the difference in freights, the results to shippers should be equal to those of last year's trading. Unfortunately there seems to be generally a lack of confidence in the trade, and the sooner this pessimism is overcome the better for every body."

"Sales of timber have been fairly heavy, but again on a lower level than that obtained last year. Waney pine is now at a price that it can favourably compete with teak for ships' decks. Although shipbuilders have been busy for some time, the present deplorable condition of the freight market is not conducive to active construction of cargo carriers, and too much must not be expected from these consumers—at least for the present. Hardwoods have kept their prices fairly well, and there appears to be a pronounced scarcity of birch timber."

A Story of What a Small Investment Did

A lumberman had invested \$55,000 all told in a new mill and its equipment. He had secured a very good superintendent and the production had mounted steadily until they were averaging an output of about 75 M. feet per day, says Berlin Quality. Above that figure production did not go however, but the lumberman thought nothing of that, for he considered that he was getting all that he could reasonably expect of his equipment. The Superintendent was a different sort, for he understood that changes in machine set-ups take time, and that orders must be gotten out, no matter how small they were, in a reasonable time. But, he argued, isn't it possible to cut down this non-productive time? Can't we have things arranged so that when we finish one order we can be all but ready to begin the next one? It sounded good but when he tried it, he found that the decreased non-productive time didn't amount to anything, compared to what he lost in the bad will of his men, because they thought he was driving them, and in the poor set-ups they made because of undue haste.

Set-ups were made as fast as changes of the heads and the changes of bits in some of the heads would allow, and many times the haste cost him good lumber.

This put him on another track, and he began figuring out a list of heads that would give him enough to allow of simply removing the heads required for one job and adjusting those for the next. This he figured would save him at least a quarter of the time then required for changes.

He figured that at an expense of about \$350 or \$400 for heads he could increase his output about 25 per cent., and he took the matter to the lumberman for his approval. After some argument the lumberman agreed to send for the extra heads; but for three long months nothing new in heads appeared in the mill.

Then the Superintendent, who had a fixed habit of increasing production at every chance, went to the office. There was some talk, not all of it in whispers, and when the Superintendent went back to the mill, the heads were ordered.

The outcome, to make a long story short, was an increase of fully 33 1-3 per cent. in output the first thirty days after the arrival of all of the heads, and the quality went up markedly.

And the best part of this story is that it is absolutely true.

Hickory is the strongest Canadian wood. When properly seasoned a hickory column will support a weight of 12 tons per square inch cross-section, which is considerably more than what could be borne by a pillar of cast iron or steel of the same length and weight.

Camp Supplies

We make a specialty of dealing in supplies for Camps and have now some particularly good values in some of the more important lines such as Currants, Raisins, Dried Peaches, Evaporated Apples, Figs, Prunes, etc.

A New Swage The Best Yet United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Utilizing Veneer Waste

The best place to utilize all the waste possible incident to veneer making and veneer using is right in the veneer industry itself, by using the product up more completely. Moreover, there is hardly another place where that old proverb of the ounce of prevention being better than a pound of cure will apply more fittingly than in the veneer industry. In other words, the best way to save or utilize veneer waste and realize from it is to make less of it. Reduce it at the source, get more out of the timber in the way of veneer originally and then handle it so as to get more of the veneer product into real service and have less of it going to trimming. This is easier said than done, but it is not impossible to do to quite an extent at least. It is really easier and much more practical to take the steps and precautions necessary for reducing the quantity of waste than it is to devise other ways and means for utilizing waste after it is made, and converting it to some good purpose.

Both figures and ideas vary considerably as to the amount of veneer waste, or rather the entire quantity of waste between the log and the available, veneer product, and between the available veneer product and the finished veneer article. Perhaps the general average will be something like 33 1/3 per cent. of waste in this available veneer product when it comes to working it up and utilizing it for face veneer or in the making of built-up lumber.

This is merely suggested as a possible tentative average to get at some basis for a line of argument and deduction on the subject of saving waste by preventing it.

One set of tabulated figures in the hands of the writer at present, taken from a rotary veneer cutting plant in operation, shows logs used during a day's run to the total of 45,000 feet, and an available veneer product of 30,000 feet. This would be a waste of one-third as compared to the original log scale, but if figured in comparison with the final veneer product, the waste pile is equal to half the amount of available veneer.

The waste in this instance is figured on the basis of board measure feet in logs as a starting point. Then the thickness of veneer is multiplied to get the inch thickness of boards. For example, 1/4 of an inch thick requires four times the quantity surface measure to make 1,000 feet board measure.

This waste becomes even more startling when it is considered that the board measure scale is calculated to allow something like 25 per cent. of waste—that is, it allows for the sawdust and slabs, which originally amounted to approximately 25 per cent. Compared to the solid contents of a log, there would be in this case a waste of the original 25 per cent. allowance in the log scale and of 33 1/3 per cent. that shows between the board measure log scale and the available veneer product. Adding to this a final waste in the using of veneer of 33 1/3 per cent., the waste item begins to assume almost staggering proportions.

The thing to do is to face this waste in its full measure and then before seeking ways and means to market it advantageously, see how much of it can be prevented by proper manipulation.

The first question of a proposition of this kind is, what makes the waste, how does it come in? The veneer machine presumably makes no kerf, that is, no sawdust; consequently it should turn out a measure practically equal to the full solid contents of the block. It is easy, however, to see that it doesn't. Figures of different mills at different times may vary materially in the totals and the percentage of waste, but all of them, all the time, show that there is a waste, that notwithstanding the allowance for sawdust in log scale measurements, the veneer product will never measure up to the board measure scale of the logs.

The investigation as to what causes this loss shows at least four different channels. The first and most noticeable one is the cores left in the veneer machine. The second on the list is end waste, the extra length of block allowed in cutting to length for trimming the veneer sheets to uniform dimensions. Third, we have waste incident to running up blocks and getting them to a shape where they will produce a thin continuous sheet of veneer. The fourth channel is that of defects developed in timber in the process of cutting and of stock damaged from one cause or another while cutting.

Taking these in the order mentioned, we have first the matter of cores. The cores or center pieces left in the rotary veneer machine ordinarily vary in size from six to ten inches. Perhaps eight inches would be an average, though much depends upon the nature of the

timber and the length of the blocks being cut and the size of the machines and chucks in use.

In districts where lots of pine is worked into fruit box stock and light package material, small machines are used working on short blocks, and the core pieces seem to vary in size from four to six inches. Large cores are very rarely seen in places of this kind. Turn from that, however, to a veneer plant cutting door stock and other large dimensions in veneer and one may find lots of cores nine and ten inches in diameter, sometimes as large as twelve inches. This is because it takes heavy machines and large chucks to hold the blocks and cut this class of veneer.

There is a way to save some of this core waste, and the veneer manufacturing trade is beginning to turn more attention to it. The simplest, and so far the most practical proposition for saving in the core waste, is to use some smaller machines for rehandling the cores and getting as much good veneer out of them as practical.

The way this matter is handled at one progressive plant is to take the cores immediately from the big machines to a smaller machine and work them down while they are still warm. If the big machine is cutting short blocks, the core may go immediately from one machine to the other. If the blocks of the big machine are too long to go into the small one, or if the ends have been battered up with the chucks, the ends are trimmed off to solid wood, making the block somewhat shorter. If the blocks from the big machines are of extra long length they are cut into two short blocks, then swung into the small machine and work down to a very small core. A big swing cross-cut saw serves to do the end trimming and the cutting of the blocks in two when necessary, and with this arrangement quite a lot more of the available veneer product is obtained than would be practical without it. Occasionally in the working of a sound log that is small originally, the little machine may get practically as much good veneer from the core as was secured primarily from the block by cutting on the big machine. Indeed there are many instances where the small machines get some excellent product from the cores. In other cases the product from the cores will not make a good face veneer—it makes fillers and backs and can be utilized to better advantage than it is possible to utilize the core in any other way. There has been enough experimenting along this line to demonstrate that it is quite practical to reduce the core waste in veneer making materially by the use of small machines for handling the light blocks and for handling the heavy cores from the larger machines.

End waste comes from the allowance made in the length of veneer blocks for trimming. It is pretty much the same allowance that is made in cutting saw-logs, with the difference that it is made oftener because the average veneer block is only about 1/4 the length of the average saw-log. The end allowance is practically the same so that in working up timber into veneer blocks there is four times the waste in end trimming that there is in the sawmill for trimming purposes.

Two general plans suggest themselves for closer utilization purposes. One is to take more pains in the work of cutting logs into blocks and reduce this allowance for end waste by closer manipulation. The other idea which suggests itself is to dispense with the core knives used for trimming the ends of veneer sheets which will permit using shorter blocks, and do the end trimming with saws after the veneer stock is dried. It ought to be practical, by a little exertion along the line of closer utilization, to reduce the amount of this end waste materially.

Some waste incident to rounding up a log or block in the veneer machine, or slag waste as we might term it, can be eliminated in many plants by the exercise of more care in centering blocks. Where blocks are carelessly centered in the machine there is an unnecessary amount of this slab waste. Where they are carefully centered and the waste is heavy because the block is not round originally we have a form of waste that is practically unavoidable. It may be practical in many instances to save this and work it into dimension veneer and utilize in the veneer work itself quite a lot that ordinarily goes into the wood pile.

The waste incident to defects in the block and in cutting is a waste that depends partly on the skill of the operator and the condition of the machine and partly on the nature of the timber being worked. Given a good sound block and machine in good condition with a sharp knife, there should be very little waste incident to damage in cutting. Perhaps the heaviest waste in cutting comes from blocks splitting before they are worked down. This may be checked a little by careful handling. The general proposition of reducing waste under this

Mr. Lumber-Dealer

Montreal West, P.Q.

head involves the use of good machinery operated only by skilled, competent men supervised by a foreman who will insist upon the machines doing their work right and getting as much good stock as possible out of every block.

What is true of the veneer cutting end is equally true of the veneer using. There is waste in using veneer as well as in cutting it. It will probably average from twenty-five to thirty per cent. and may go as high as fifty per cent. in some instances. It will never be possible to prevent waste in this work entirely, but it should be practical to reduce the amount of waste through the exercise of care and thoughtfulness in selecting and working veneer.

Part of it is a matter of selection and of fitting veneer to the work and part of it is a matter of closer manipulation just as in the case of the end waste and the core waste. In trimming veneer and in making up panels, allowances are made for end trimming and for side trimming, for cutting to exact size, and sometimes these allowances are made with such a liberal hand that they unnecessarily increase the waste. More care in the work and closer manipulation will reduce this materially, and thoughtfulness and care in cutting and trimming veneer will make it practical to use a fair percentage of trimmings from one job on another and thus utilize material that otherwise goes to waste.

So both in the making and in the using of veneer there are many opportunities to use up the product closer and reduce the item of waste, and after all is said, this is the best utilization that can be devised for veneer waste, and it holds generally for wastes of all classes and kinds.—J. C. T. in *Hardwood Record*.

System in Business Affairs

So much that is wordy and dull has been written and said in connection with "system" in business affairs that a concise discussion of the subject, in forcible words, is refreshing and important. We reprint from an exchange, the following; knowing that it will appeal to lumbermen, manufacturers, wholesalers and retailers:—

"Success or failure of any business enterprise rests almost wholly with the ability of its manager. It is true that this rule does not always apply because we have examples of men of small ability but phenomenal success as well as examples of failures where able men have presided. But these cases are the exception rather than the rule and there is no question but that the greater success in business results from the ability of its management. A location may be poor, and trading light, but even such conditions can be overcome by the personally capable manager. All success is, in the first place, based on system. System can best be promoted through the keeping of records and through comparison of these records to learn the short cuts to progress. Records are the foundation of all progress, whether of the nation, the business corporation, a private institution, or the individual life of any human being. Making use of immediate, reliable, adequate and permanent records is the first practical principle a man entering business has to contend with. It has long been the basis of system employed by great business institutions, but many private individuals and personal enterprises do not place the importance on this department that they should, because it sometimes demands time they think can be put to more profitable advantage in other ways. As a consequence, many of these records are half kept and their value lost. It is only through the keeping of records that our business experiences become of value. What is done is done, but what is yet to be done lies in the hands of the individual to mold or mar as he is able. His ability is a result of his experience and that experience should become the basis of his schedule for the future. A schedule to be of value must be definite. The guess work must be eliminated and concrete data, material and equipment substituted. Railroad companies lay out their work in advance and the time table is a good example of their schedule.

Standardization of Methods

"A thing begun and ended on time and performed in the way it was intended is of greater benefit to the developing business man than a half a dozen things half done. A mislaid note book, tool, or instrument of any kind has caused endless waste of time. Carelessness about equipment on a larger scale has meant destruction of property and injury or death to mankind. Between these two extremes occur thousands of cases of daily waste in life, property and energy through unstandardized conditions. It is simply a matter of the right thing in the right place at the right time. Much of our great national fire loss could be prevented by having a systematic way of disposing of all waste and the making of regular inspections to the end of removing all unnecessary hazards. All of this is standardization of methods. Doing a thing over and over again in the same manner until the right operation becomes a habit. It is the surest way to break away from tradition and avoid guess work.

Records for Reference

"For many people, thought and purpose are elusive things, hard to control, and difficult to retain. Although memory in these cases

should be called upon to do service, the value of crystalizing thought and purpose into written words is a character of records indispensable. The aggressive business man is forever and always casting about for newer principles and more short cuts to a specified end. To make a permanent record of this, these same men make time and motion studies of their own day's guides for saving time, and as a means of inspiration to the strengthening of the will and in some other practical ways. In a short space of time this system becomes a producer of great results. Ideals are always the parts toward which the human craft is steered. Without them humanity loses ambition and without ambition a man becomes the slave to other and greater powers. An ideal is the most practical, fundamental thing in man's life. The practice of getting and attaining minor things is developing a spirit which in the end helps to gain and attain the greatest of man's ideals. It is this one thing alone that marks the world's progress and all men who become successful men must harbor within themselves the desire of attaining some definite ideals. To overtake this ideal, however, common sense must be used, and safe and sound judgment govern every step toward the desired end. Unwise judgment has in it every element of disaster. Progress resulting from careful judgment at times seems a trifle slow in developing, and for this reason men are often apt to forget their better judgment and plunge. One leap of this nature often tears down all of the good resulting from previous progress under the guidance of better judgment. It is said that no obstacle is so great that there is not some way around it, under it, or through it. To the man who is governed by careful judgment, these obstacles have less terror, but to the haphazard individual every obstacle becomes a new one, whether he has surmounted a similar one or not and business life must become a daily terror.

Progress Requires Energy

"Physical and mental laziness, of course, never becomes a power in successful upbuilding. Lack of concentration, unhealthful habits, pleasure madness, are some of the things which get hold of our young men of the present age and is a state of mind which does not permit of the development of more practical and efficient methods. It is this class of men who bring up the rear of our commercial armies, and because of their lack of will power are doing injustice to themselves, their community and society in general. To be worth one's hire is one thing, but to be worth more than one's hire should be a condition strived for by all. To make yourself want what you want hard enough to work for it is to exercise oneself in self discipline. One of the greatest reasons why the majority of men fail to attain their ideal and get their reward is because they do not want them hard enough. One of the greatest principles of self development is personal energy. Whether a man really lives or merely exists depends almost wholly upon his willingness to develop his personal energy and willingness to do lends itself charmingly to the best results."

Sale of Lumber and Pole Stumpage in Idaho

The United States Government is offering for sale two tracts of timber on Lolo Creek within the Clearwater national forest, Idaho, aggregating 600 million feet of saw timber and 350 thousand cedar poles, together with a considerable amount of material for poling, shingles and posts. A large part of the timber is Idaho white pine, but the stands include yellow pine, lodgepole, spruce, western larch, Douglas fir, cedar, and white fir. The prices, which represent the lowest rates which will be considered for the saw timber, range from \$3.50 for green white pine to 50 cents a thousand for Douglas fir, western larch, and cedar. The prices of poles range from 5 cents to \$2.40 apiece, depending upon the size.

The Frank H. Harris Lumber Company, Limited

The attention of our readers is called to the advertisement of the Frank H. Harris Lumber Company, Limited, 32 Church Street, Toronto, wholesalers of hardwoods, oak flooring, chestnut, walnut and yellow pine. The president of this newly incorporated company, Mr. W. H. Harris, has had a long experience in the lumber industry both in Canada and the United States. He was formerly general manager of Houston Bros., Vicksburg, Miss., one of the largest manufacturers of hardwoods in the south. Mr. F. H. Harris, the secretary-treasurer, is well known to the Ontario trade, and has been in the southern pine business both in Toronto and the south for a number of years. The new firm have connections with some of the leading firms in the Southern States.

The Lieut-Governor of New Brunswick has named the following members to compose the Royal Commission to enquire into the recent charges preferred against Hon. J. K. Flemming, former Premier of the province, in connection with the administration of the provincial timberlands:—Sir Frederick E. Barker, formerly Chief Justice of New Brunswick, chairman; Hon. H. A. McKeown, Judge of the Kings Bench Division of the Supreme Court, and Mr. W. S. Fisher, of Emerson and Fisher, Limited, Merchants, St. John.

W. F. Vanstone, Wingham, Ont., is considering the purchase of sawmill equipment including lath, heading and shingle machinery, to be operated at Blyth, Ont.

R. W. E. Burnaby, 45 Adelaide Street East, Toronto, will install a lumber yard and planing mill at Davisville, North Toronto. A site has been secured, 67 ft. x 325 ft.

Todd & Joynt, St. Helens, Ont., are seeking information as to prices of machinery for equipping a heading mill, also prices of a 40 or 45 h.p. engine to operate a sawmill.

Waterloo, Ont., has carried a by-law to make a loan of \$50,000 to the Globe Furniture Company. The company will erect two additions to their plant, at a cost of about \$125,000.

William Beatty Lands and Timber, Limited, has been incorporated with a capital of \$100,000, with head office at Parry Sound, Ont. The provisional directors are W. J. Beatty and I. E. Beatty.

The planing mill operated by Esdale & Douglas, Lisgar Street, Ottawa, was recently destroyed by fire. All the machinery, valued to \$3,000 was destroyed. The building was owned by A. G. Acres, Bank Street.

South America Cabinet Woods, Limited, has been incorporated with a capital of \$1,000,000, with head office at Toronto. The provisional directors are H. F. Welsh and C. J. F. Collier, both of Toronto, Ont.

A. Barnet & Company, Limited, has been incorporated with a capital of \$250,000, with head office at Renfrew, Ont. The provisional directors are A. J. E. H., T. F., and J. G. Barnet, of Renfrew, Ont., and J. C. Browné, of Ottawa, Ont.

In order to secure a piece of property adjoining their plant, upon which to pile lumber, the Otto Higel Company, manufacturers of piano actions, King and Bathurst Streets, Toronto, paid \$400 a foot making a total of \$24,000 for the 60 feet frontage.

The McEachern Tie and Timber Company, Limited, has been incorporated with a capital of \$40,000, with head office at Thessalon, Ont. The provisional directors are E. S. Perryman, of Chicago, Ill., U.S.A., J. A. McEachern and W. McGuire, of Thessalon, Ont.

The Abitibi Pulp and Paper Mills, Limited, 136 St. James Street, Montreal, have awarded the contract for their paper mills at Iroquois Falls, Ont., to Morrow & Beatty, Peterboro. The architect for the plant is Mr. Geo. F. Hardy, 309 Broadway, New York City.

The Ladder Lake Lumber Company, Limited, has been incorporated with capital stock of \$400,000 and head office at Toronto, to carry on a lumber manufacturing business. The provisional directors are G. Ruel, A. J. Reid, W. L. Pinkney, G. N. Pimprich and H. R. Burrows, of Toronto.

The McAuliffe, Davis Lumber Company, Ottawa, Ont., are enlarging their Duke Street mill to double its present size. The cost of the work will be about \$25,000. The enlarged mill will be about 100 ft. x 200 ft. It is expected that the machinery will be installed this month. It will include a large new rig saw, made by the Berlin Machine Works, Limited, Hamilton, Ont.

Philip Forbes, Lions Head, Ont., is constructing a sawmill on the site of the former mill belonging to Chas. Pedwell which was destroyed by fire last fall. The mill will be equipped with a Waterous pony band, and will be up-to-date in every way. Mr. Forbes has been interested in timbering in the Bruce Peninsula for the past fifteen or twenty years, but this is his first experience at the sawmill end of the industry.

Driftwood Lands & Timber, Limited, was recently incorporated with head office at Toronto and capital stock of \$1,000,000. The provisional directors are J. L. Ross and A. W. Holmstead of the firm of Ross & Holmsted, Barristers, 20 King Street East, Toronto. The promoter of the company is J. H. F. Blue, 20 King Street East, Toronto. The company have bought 47,407 acres of mahogany and cedar lands in Dutch Guiana. These lands are reported to contain a great quantity of mahogany, cedar, purple-heart and greenheart. The intention of the company is to erect a large veneering plant at some lake point in Ontario, possibly Oshawa.

Eastern Canada

It is reported that H. W. Woods will not operate his mill on the Nerepis, N.B., this year.

The Wilson Box Company have rebuilt their mill at Westfield, N.B., and it is now thoroughly up-to-date.

La Compagnie St. Ramuald d'Hardwood Flooring Company, Limited, has been registered at St. Romuald, Que.

The sawmill belonging to Hamel & Allard at Ancienne Lorette, P.Q., was recently destroyed by fire. The loss was covered by insurance. The mill will be rebuilt and new machinery will be required.

The Riddle, Robbins Lumber Company which constructed a mill last year at Hatfield Point, Kings County, N.B., will not operate this year on account of some litigation between those who are interested in the company.

Timber Properties and Securities, Limited, has been incorporated with a capital of \$50,000, with head office at Montreal, Que. The provisional directors are W. R. L. Shanks, advocate, and F. G. Bush, both of Montreal, Que.

The mill at Upper Gagetown, N.B., recently operated by the Warren Company, will not be running this season on account of the death of the owner. It is now being offered for sale by L. G. Crosby of St. John, a former part owner.

The sale by auction of the timber limits of Messrs. H. M. Price & Company, lumber merchants, Quebec, now insolvent, will be held on August 5th next, at the offices of Messrs. La Rue & Trudel, accountants, 126 St. Peter Street, Quebec. The limits include a total of 527 square miles, along the rivers

St. Jean, Saumon, Magpie, and Chambers; also a certain area of freehold land to be used as a mill site. Particulars may be had from A. F. C. Ross, c/o P. S. Ross & Sons, 142 Notre Dame Street West, Montreal, or Eugene Trudel, c/o La Rue & Trudel, 126 St. Peter Street, Quebec.

The box factory belonging to the Turner Lumber and Pulpwood Company, of Limolieu, P.Q., was recently destroyed by fire. The loss, amounting to \$2,000 was covered by insurance. The company will rebuild and will require new machinery.

The Federal Paper Company, Limited, Montreal, P.Q., has been incorporated with capital stock of \$100,000. They are given power to manufacture, buy and sell pulp, pulpwood, etc. Mr. J. J. Meagher, 232 St. James Street, Montreal, is interested in the company.

Christie's woodworking factory on City Road, St. John, N.B., was completely destroyed by fire recently. The total value of the plant was about \$40,000 and there was insurance to the extent of \$20,000. Mr. Christie reports that a new factory will probably be built.

The Boyer West Realty and Lumber Company, Limited, has been incorporated with a capital of \$49,000, with head office at Montreal, Que. The provisional directors are T. Rinfret, K.C., J. E. Billette, A. R. W. Plimsoll and R. Brodeur, advocates, all of Montreal, Que.

The Lower Ottawa Forest Protective Association, Limited, has been incorporated with a capital of \$10,000, with head office at Hull, Que. The provisional directors are Hon. W. C. Edwards and W. C. Hughson, of Ottawa, Ont., G. H. Millen, of Hull, Que., J. B. White, of Montreal, and R. M. Kenny, of Buckingham, Que.

A staff of engineers under the direction of Mr. A. G. McIntyre has commenced the preparation of plans for the new pulp mill which is to be erected by the Bathurst Pulp & Paper Company, at Bathurst, N.B. It is expected that nearly a thousand men will be employed in the construction of the plant, which will be built entirely of concrete and steel.

The sawmill belonging to Joseph Bedard & Sons, at Bedard's Mills in the township of Cleveland, near Richmond, P.Q., was recently destroyed by fire. The loss is placed at about \$5,000 and was partly covered by insurance. A quantity of lumber was also destroyed. The mill will be rebuilt at once, as the company have a large quantity of logs on hand to be cut.

Western Canada

G. D. Benoit, lumber merchant, of Dollard, Sask., has been succeeded by J. A. Pamchand.

The Canadian Cedar Lumber Company, Vancouver, B.C., has bought the saw mill operated by W. H. Day, South Vancouver.

The Forest Products Company, Limited, has been incorporated with a capital of \$100,000, with head office at Vancouver, B.C.

The James Brookes Woodworking Company, Limited, has been incorporated with a capital of \$15,000, with head office at East Burnaby, B.C.

The Sunset Lumber Company's plant at Bradner, lower Fraser valley, has been bought by Craig & Taylor, formerly with the Mission Lumber Company.

The Federal Lumber Company has acquired the cedar mill on the north arm of the Fraser River, formerly operated by the Leading City Lumber Company.

The M. B. King Lumber Company, which recently bought limits from D. K. Campbell, is erecting a mill on the B. C. Electric Railway, south of New Westminster.

Charles Hartnell & Son, Vancouver, have taken over the sawmill at Port Hammond, one the main line of the Canadian Pacific Railway, twenty-five miles east of Vancouver.

The Western Canada Manufacturing Company, Limited, has been incorporated with a capital of \$100,000, with head office at Vancouver, B.C., to carry on business as lumber merchants, etc.

The British Canadian Lumber Company has started its mill at Coal Harbor, Vancouver. It has had a number of logs in the water, and as the teredo is getting busy it was deemed advisable to get the mill going again. It is expected that operations will be continued throughout the summer.

A report from Vancouver, B.C., states that the Vancouver Lumber Company, Limited, are preparing to erect a shingle mill at a cost of \$100,000 at Roche Point, Burrard Inlet, B.C. The plant will have twelve shingle machines. The company are also erecting a wharf, completing a large frame boarding house and making a number of alterations to their cedar mill.

A deal in standing timber in the neighborhood of Fort George, B.C., has just been carried out by the Government of the Province which has sold to Mr. H. N. Sereth, of the Riverside Lumber Company, of Calgary, 32,000,000 feet of lumber at the following prices: Douglas fir, \$2.54 per 1,000 feet; spruce, \$1.07 per 1,000 feet, and cedar, \$1.06 per 1,000 feet. The total value of the timber reaches \$37,000, the purchasers to cut this within the next two or three years and leave the ground as nearly as possible ready for settlers, with the brush burned off.

A report was recently published to the effect that the McLaren Lumber Company of Blairmore, Alta., intends to erect a mill at a cost of \$200,000. This company has been acquired by eastern capitalists who will spend a large sum on important additions to the plant. Mr. E. A. Cunningham of the Rogers-Cunningham Lumber Company, Lethbridge, Alta., will be the general manager of the company. The McLaren limits are between the C. P. R. Crow's Nest branch and the south fork of the Old Man river. The new mill will be of large capacity, and will manufacture lumber of the standard mill stock sizes and patterns. The organization will be capitalized at \$1,500,000.

The Crossing Lumber Company, Winnipeg, Man., whose mill is located at Minaki, Ont., report that their logging operations last winter were entirely successful. They expect to have about 3,000,000 feet of lumber. They had a crew of 75 men and 32 horses in the woods. They have built a pier 160 feet long and cleared up all the debris on their property, expecting to put it on the market as a summer resort proposition this year. The G. T. R. have completed two large hotels, within half a mile of the mill, one a winter house, to be operated throughout the year and one a summer house to be opened on June 26th. The railway has also put into commission a launch 47 feet long running between the station and the hotel. The Crossing Lumber Company are therefore looking for an exceptionally busy season this year.

ADAMS TOWING MACHINE

This machine installed in our pointer will do the work of a steam tug as well as many things a steam tug cannot do. The machine is strong and amply designed, burning coal-oil as fuel. Machine starts direct off coal-oil.

The pointer is particularly well built.

Ribs and frame are bolt fastened; they are made of well seasoned white oak, steam bent where necessary.

The planking is Louisiana Red Cypress.

Rubbing streaks are of hard maple.

The Adam's Pointer has proved a good investment for many lumbermen. Write for catalogue and testimonials.

Behind Every Forest Product Is a Saw

From the moment the forest giant is marked for cutting a saw enters into every operation. The Cross-cut Saw is used for felling and cutting the tree into log lengths; the Band and Circular Saws are employed in manufacturing lumber from the logs, and the re-sawing into boards. In view of this importance of the saw to the lumber industries it is worthy of note that

Disston Saws Band—Circular—Crosscut

take the leading part in turning the rough timber of the forest into merchantable lumber.

While much depends upon the care which the filer gives the saws, it is a fact that the best lumber can only be obtained from the best and most efficient saws. The widespread use of Disston Saws, therefore, show that saw users in the lumber world have come to recognize their unvarying dependability, and

SPARTAN

LEATHER BELTING

is the result of extensive chemical researches and the testing of many different tannages of leather.

Where abnormal external conditions exist Spartan Belting should be employed, as the specially tanned leather and the special cement used in its construction resist the injurious effects of water, steam, oil, gas fumes, and heat generated by excessive pulley friction.

For overloaded drives where it is not feasible to get greater power by increasing the belt speed or the width of the pulleys to enable the use of wider belts, recourse should be had to Spartan Belting, remarkable for its pliability and consequently increased pulley grip and its great tensile strength.

In short, Spartan Belting is adapted for use under all abnormal service conditions—particularly suited for use in saw and planing mills. Its use will ensure your plant against transmission troubles, power losses, and shut-downs for repairs.

Spartan Booklet and full details sent upon request. Why not investigate.

It is time to think about your logging equipment for the ensuing season. Let us figure on your requirements for Peavies, Cant Hooks, Timber Dogs, Boom Chains, and Shackles, Mill Chains, Forged Steel, Log Stamping, Hammers, etc.

Our products are the result of over 50 years of careful study of the lumberman's requirements and we can offer the best equipment at the lowest price.

Write us for particulars and prices.

ARGALL BROTHERS Three Rivers, Quebec

MERRITT MFG. CO., Lockport, N.Y.

Veneer Machinery

THE "MERIT" LINE of Veneer Cutting, Dimensioning and Drying Machinery is designed first, for veneer mills cutting high grade furniture and commercial veneer from expensive timber, and second, for basket, crate, box and barrel factories using cheaper veneer cut from the less expensive woods.

Merit Veneer Lathe

In addition to Lathes, Clippers, and Driers, the line, includes Knife Grinders, Log Hoists and Trolleys, a set of Crate Head Machinery, a set of Barrel and Basket Hoop Machinery, Basket and Hamper Bottom Rounders, Nailing Forms, etc.

"Wilson Bros." Flooring and Trim

"Wilson Bros." stamped on every piece of this flooring stands for Quality. Look for the name.

Hardwood and Pine

Interior Finish of all kinds

Also Hardwood Veneer Doors to Detail

We are equipped to fill large or small orders on short notice. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

GOODHUE BELTING

FACTORY TO YOUR MILL

TO the saw mill and woodworking industries we offer an unusually good belting value in our "Acme Waterproof." This belting is specially made from the best hides to run in wet places where only the best quality belt can "make good." If you require any belting you should enquire into the merits of "Goodhue Belts" then you will buy a "Goodhue."

According to the conditions under which a belt has to run we recommend "Extra," "Standard" or "Acme Waterproof"—each brand the best quality but each made for a different service.

Send for particulars
and prices.

"On to Toronto!"

YOU have doubtless noted with gratification the great movement for honesty and square dealing which is revolutionizing American and Canadian business methods. Our goods, our salesmanship and our advertising are being cleansed and vitalized by the spirit of truth and sincerity.

As a result we see a growing public confidence in manufactured products and their advertising—a confidence which, if preserved and fostered, will decrease our costs, increase our profits, and become a business asset of incalculable value.

Foremost in the fight which has brought about this revolution stand the Associated Advertising Clubs of America, whose emblem is shown above. If you are a business man, interested in the manufacture, distribution, or selling of commodities of any nature, you should attend the Tenth Annual Convention of the A. A. C. of A. at

TORONTO

June 21-25, 1914

At this Convention you will hear the inspiring story of the manner in which these tremendous reforms are being effected. More than this, you will hear the problems of distribution, merchandising, salesmanship and advertising discussed by able and successful business men in a series of open meetings.

These meetings will cover the questions of chief interest to the 10,000 business men comprising the 140 clubs of the A. A. C. of A.—*your own* problems included.

EDWARD MOTT WOOLLEY the famous writer on business topics, has written a booklet entitled "*The Story of Toronto.*" This booklet describes in a forceful, intensely interesting manner, the wonderful work the A. A. C. of A. are doing for clean advertising and square business methods, and the significance and importance of the Toronto Convention. This booklet will be sent free to all business men asking for it on their business stationery—together with detailed facts as to the convention programme and rates for accommodations.

"THEY SURE DO RUN UNIFORM"

A Michigan saw filer of many years' experience says this about

Aloxite Saw Gumming Wheels

*His tests and his results
prove it*

He finds that they cut fast and clean without burning—that they hold their shape—show long life and are positively uniform in grit and grade. ¶ A study of saw-filing requirements and conditions enables our service department to put

*The Right Wheel in the
Right Place*

All F.O.B. Jamestown, New York.

Yes Sir! Cling-Surface is unequalled for rope treatment. Here is proof.

These illustrations show two ropes in the plant of the Crystal Ice & Storage Co., Buffalo, N.Y., that have been typically benefitted by Cling-Surface treatment. Ernest J. Lancy, Chief Engineer, has this to say:

"Cling-Surface has done these ropes much good by not only preventing slip with less tension, but by keeping them pliable, waterproof, and keeping all the fibres lubricated, which reduces the internal friction and outside wear. We recently installed a new rope, and intend to start right with Cling-Surface. We get best results applying the Cling-Surface

as the rope enters the sheave on the tension carriage."

Cling-Surface is of as great value for ropes as it is for belts. It acts for ropes much as it does for a porous belt, gradually penetrates all through, keeping the whole rope pliable and in best physical condition. Cling-Surface makes each fiber slide smoothly against its neighbors, which is better than the dry internal grinding and chafing that occurs without Cling-Surface treatment and is so destructive.

If you have a difficult drive on which other methods of preventing slip have failed and on which you would like to try Cling-Surface, let us know. Write today and get details. We will be glad to quote f.o.b. Toronto.

DIXON'S GRAPHITE WIRE ROPE GREASE

This mixture of Dixon's fine flake graphite with a heavy bodied mineral grease, accomplishes two very valuable objects. The grease and graphite penetrate throughout the rope or cable, coating each individual strand with pure graphite and giving perfect lubrication both internal and external, so that the rope lasts longer. And this graphite coating is a positive protection against rust and corrosion. It cannot wash off. Send for "Wire Rope Lubrication," No. 238.

**WHY you should install the Mahony Blower****System in your Planing Mill**

Fifty per cent. higher efficiency than any other on the market to-day, uses 1/2 less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk ... 3 feet by 6 feet 3 inches
Diameter and Length Mandrel ... 2 3/16 by 55 inches
Size Drive Pulley ... 20 by 10 inches
Feed per Revolution of Saw ... 0 to 3 1/4 inches
Feed Belt ... 4-inch Gandy
Largest Diameter Saw ... 56 inches
Length of Carriages ... 12, 16, 20 or 24 feet

Width of Carriages ... 33 inches
Trucks ... 7-inch wheels and 1 1/4-inch axles
Length Track ... 32, 40, 48 or 56 feet
Style and Opening of Blocks ... C1-36 inches
Style Mill Dogs ... Pony Excelsior
Style Set Works ... No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Berlin Matcher Success has been Earned

Berlin Matchers have proven absolutely successful during the past year.

By "successful" we mean that our every claim as to their efficiency, producing ability, quality of lumber manufactured and low up keep cost in operation, has been substantiated with every installation of a Berlin Matcher

More is expected of a Berlin Matcher than any other because Berlin Matchers have always been successful. And Berlin Matchers have always given more than was expected because they are Berlin Matchers.

And this success did not just happen. It was earned by the combined efforts of the most able Berlin Engineers.

Their supreme efforts have been centered upon the one object sought; the pre-eminence of Berlin Matchers as producers of finished lumber.

That necessitates the possession of features or qualities of acknowledged superiority.

Superior design of working features, of supports for those features and of auxiliaries for their immediate assistance in producing perfectly manufactured lumber, possessed by Berlin Matchers has assured their pre-eminence.

And this has all been earned by diligent, consistent and persistent effort to supply our patrons with the best Matchers that engineering ability, plus the experience of practical mill men, carefully applied, could produce.

It is the result of attempts, year after year, to perfect a machine that would manufacture the finest lumber at a cost that insures a profit.

Our efforts have been crowned with success. And, it is to be your success as well as our own. For Berlin Matchers operating in your plant will assure a profit on the finished lumber they produce.

On paper we can give you only our claims,—reasons why you should, at least, investigate the ability of a Berlin Matcher to finish your lumber at a lower cost than you are now manufacturing it.

Given the opportunity we will be glad, actually to demonstrate that ability, in a Berlin Matcher.

The features that made this matcher a success are described in a circular that you may have on request.

THE BERLIN MACHINE WORKS - - Hamilton, Ont.
United States Plant - - - - - Beloit, Wis.

Horizontal Slab Re-Saw

A Horizontal Slab Re-saw will increase the capacity of a saw-mill from 15 to 25 M ft. at a less cost for equipment and a less cost for operation, than can be accomplished in any other way.

One customer in Canada has purchased 7 of our Re-saws, another 4 and another 3. Catalogue gladly furnished without obligation to you. It also illustrates many special Box Factory Machines.

KEEP THE WORK GOING

Nothing is more important in logging than the prompt and certain movement of cars.

Delays affect the whole work. To avoid delays, locomotives must be reliable and always ready for service.

Our standard logging locomotives are built to insure reliability and constant service. Only tested materials are used in their construction. All wearing parts are made to templates and gauges. Interchangeability of like parts is guaranteed, and long delays waiting for duplicate parts avoided.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton
Climax
Locomotive
Designed
Especially for
Heavy
Logging Work.

Climax Locomotives are successfully operated on steep grades and sharp curves. Any weight or gauge. Locomotives in stock for immediate shipment. Get Catalog "H."

CLIMAX MANUFACTURING CO., 313 W. Main Street, CORRY, PA.
VANCOUVER MACHINERY DEPOT, LTD., VANCOUVER, B.C.

HEISLER GEARED LOCOMOTIVES

Especially adapted for heavy hauling on steep grades, sharp curves and uneven tracks. For logging, switching and pulling on main lines, mills, furnaces and industrial purposes.

Engine being operated by the Trout Creek Logging Co., Ltd. of Trout Creek, Canada

Just Off the Press—New Detailed Descriptive Catalog 108 G.C.

Heisler Locomotive Works

ERIE, PA., U. S. A.

Whitney Engineering Co., Tacoma, Wash., North Western Sales Agent

Logging Locomotives

Mikado Type Locomotive, Polson Logging Co.

The Mikado is a good type for heavy hauling, where runs are fairly long and high steaming capacity is needed. The locomotive illustrated traverses 30 degree curves, and can be used on rails weighing 45-50 pounds per yard. It is simple in construction, strongly built, and rides well on uneven tracks.

When in need of a logging locomotive, consult

The Baldwin Locomotive Works

Philadelphia, Pa., U. S. A.

**Logging Locomotives**

The knowledge and experience of fifty years in locomotive designing and construction is what you get in our Logging locomotives. They are specially constructed for logging operations and will stand up to the severe service in which they are expected to run.

They are as carefully designed and built as our 200 ton locomotives. Repair parts may always be obtained on the shortest notice.

May we send you specifications

Canadian Locomotive Company, Limited, Kingston, Ont.
Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

There's a Reason

why our

"SUPERIOR" LATH MACHINE

gives such general satisfaction.

At your request we will mail list of users, testimonial sheet and descriptive circular.

You realize, of course, the advantage of installing a well-built, reliable Lath Machine if you intend sawing lath at a profit. We feel confident that should you put in our Lath Machine you will admit that we were quite right in naming it the "SUPERIOR."

Mills Like These *Are Using—* **WATEROUS MACHINERY**

You will find Waterous Equipment in those Canadian Mills where fast and accurate cutting are essentials.

Waterous Sawmill Machinery is being used because it is built for that kind of work,—it is the result of more than 50 years' intimate knowledge of Canadian sawmilling conditions.—The men who use Waterous machinery know that it will give the service they expect.

Our reputation for "knowing how" is a guarantee that every piece of equipment you buy from our shops is the last word as regards Sawmill machinery. You can bank on the results it will give you.

There is a Waterous equipped mill in your neighborhood—we will be glad to tell you where. Watch our machines at work and ask the operator and the owners what they think of them—we will abide by what they tell you.

"FROST KING" METAL

\$5,000,000.00

worth of mixed metal
sold annually.

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

Timber Concessions in the Province of Quebec

Notice is given by the government of the province of Quebec that, on the 11th of August and on the 20th of October, 1914, permits to cut timber on over 8,000 square miles of crown lands will be offered at public auction.

The territory to be disposed of comprises some 1200 square miles in the basins of rivers Ottawa, Harricana and Bell, in the Abitibi region; 6,000 square miles in the lake St. John northern region; 350 square miles in the lake St. John East agency; 242 square miles in the Matapedia division.

On the first date above mentioned, permits will be offered at ordinary conditions on some 3,000 square miles.

The timber grants advertised for the 20th of October, comprising the basins of three large rivers in the lake St. John region with considerable water powers, will be subject to the obligation of manufacturing the wood into pulp or paper within the province of Quebec.

For particulars, please apply to the Department of Lands and Forests, Quebec, Canada.

Elz. Uiville Dechene

Deputy-Minister of Lands and Forests.

WHY you should install the Mahony Blower System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

ADAMS COAL-OIL POINTERS

A big advantage of the Adams Pointer is that coal-oil may be used as fuel instead of gasoline. This oil is found in every camp in the country, it is cheaper, safer and more convenient than gasoline and is just as satisfactory.

Adams Pointers reduce your river costs.

Adams Pointers do the work of from six to ten men. One man operates all machinery.

Adams Pointers carry your men to work and leave them fresh for the day's work.

Adams Pointers draw themselves over rapids and portages.

Adams Pointers can be used for warping and sweeping logs out of corners that an Alligator could not reach.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 1 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Vol. 34

Toronto, June 1, 1914

No. 11

A Time for Confidence and Courage

The continuation of a state of trade strongly marked by absence of large orders, is reported from practically all parts of Canada. The reasons for this have been discussed time and again, during the past few months, by the trade and by trade journals, and though there is a fairly general agreement as to the causes and the results, no one is inclined as yet to express a definite opinion as to how soon conditions will take a change for the better. The lumber trade is probably in a better position than most other lines of business to stand this quietness and to pass through the period of poor business. It is noticeable indeed that lumbermen, while feeling the effects of the depression are in a more hopeful frame of mind and are doing less worrying than those engaged in other industries and trades. This may be accounted for by the fact that the manufacturers of lumber particularly in Eastern Canada, did not over-produce during 1913, and that stocks of nearly every description are sufficiently low to prevent any slump in prices. The competition of stocks from the United States however, has done a great deal to unsettle price conditions, and many of the Ontario producers and handlers of lumber have been anxious about this situation for some time. While there is reason enough for them to feel anxious, and to watch carefully for any silver lining to the business clouds, or for indications of further bad weather, we believe, and many of the best informed members of the trade are of the same opinion, that there is no necessity to-day, and probably will be none before more active trade develops, for giving away stocks at prices which afford no profit. In the face of strong competition and a declining demand for stocks, lumber prices were maintained remarkably well during the past winter and during most of last summer. There is no reason at present to fear that they will not continue to hold until the period of depression is past.

Although large orders for lumber stocks have become very scarce,

the present conditions have been in force so long that they are getting down almost to what may be considered a normal basis during quiet times. In Canada, probably more than in any other country in the world, a great deal of steady expansion is in progress. The speculative expansion which inflated business conditions so seriously for a few years, until about a year ago has been entirely checked. The natural growth of the country to-day is so considerable that it causes the consumption of a sufficient quantity of lumber to constitute a fairly active trade. That this is the case, is not admitted by everybody, but good evidence in regard to it is afforded by the number of lumbermen who report that they are quite busy. Some even, have reported increased sales as compared with the early part of last year. If manufacturers and dealers in lumber can continue the policy of patient waiting which they have been practicing, the trade will probably come through the dull period in good shape and be in a position to take good care of active business conditions whenever they develop again.

How soon business conditions may be expected to improve permanently is a matter of doubt and we do not find anyone in business who wishes to be set down as a prophet in this connection, but there has been a general feeling for a few months past that the present summer will see trade commencing to improve. The remarks of Hon. W. T. White, Minister of Finance in the Canadian Government, upon the occasion of the presentation of his recent budget, formed probably the most encouraging statement in this connection which can be quoted, and as they come from a man who is in a better position almost than anyone else in Canada, to understand the world-wide conditions which have brought about the depression, his views are of the greatest importance. "There is no doubt," Mr. White said, "that the severe and prolonged financial stringency through which the business world has passed and from which it is only now emerging, marked the culmination of one of those so-called trade cycles well known to economists. Viewing world-wide conditions during the past few years it is apparent that such a cycle has been passed through. We have seen normal money conditions, good times throughout the world, the expansion of enterprises, vast increase in capital expenditure upon railway and other construction in Asia, India, Egypt and in North and South America. Last year there was experienced a shortage in capital in all the financial centres, with constantly increasing interest rates, until after a period of prolonged and severe liquidation and the elimination of vast amounts of inflated values, something like normal money conditions again prevail. The world is now in a period of general, but it is hoped, temporary trade slackening. Without such slackening the financial stringency must have continued. The trade slackening alone could bring it to its appointed end. The conditions I have referred to are world-wide. We are particularly interested in those of Canada. Our production has shown a most gratifying increase in all the great departments of our national activity. In foreign trade this has been our greatest year. What is our present outlook? Bankers and business men unite in the opinion that while it is a time of prudence and caution, it is also a time for confidence and courage."

A Dangerous Fire Season Expected

Reports which have been received by the Forest Branch of British Columbia indicate strongly that there is much likelihood of a hot, dry summer occurring this year and that, on this account, the danger from forest fires will be greater than usual. This is a matter of importance to all timber owners and the Forestry Branch has commenced sending out letters to logging operators, to warn them of the danger, and to secure their co-operation in burning off all the logging slash at a safe season. In one of these letters the Forest Branch states that the most dangerous places are near buildings and along railroad rights of way and public roads. These should be looked after first. By observing the following simple rules the burning may be safely done.

1st. Burn as early in the spring as possible. If the burning was not completed before May 1st, a permit should be obtained from the local forest guard and the burning carried out under his supervision. Delay should not be made until the soil becomes too dry,

because valuable vegetable matter which enriches the soil will then be burnt up.

2nd. Always construct a light fire break around the slash, by throwing any brush or litter in for say 20 ft. This will confine the fire and give a chance to get around it quickly should it start to spread.

3rd. If possible have one or more neighbors assist in burning so that the fire may be controlled at all times.

4th. Always start fires in the afternoon if conditions are at all dry. The best time is about five o'clock. The brush is then dry from an all day's sun and burns better. There is little chance of a wind springing up, and the fire burns out during the night.

5th. If the slash adjoins timber, start from the timber side and burn out until a good guard is burned all around the timber. Start fires on the upper side of a side hill slash and burn down the slope. When a good guard has been burned along the top fires may be set at the foot of the slope and allowed to burn up.

6th. Burn over the area as quickly as possible.

7th. Keep close watch on this area until all fires are out.

In another letter which has been sent to operators upon whose property the Forest Branch knows of the existence of considerable areas of dangerous slash, attention is drawn to the increased danger to camps, logs, and all other logging property, by allowing the slash to remain. While it is impossible to say definitely what are the best methods of burning with safety the following rules are given as certain to be of assistance:—

1. Always construct a trail or a light fire-break around the slashed area before starting fires. This will serve to confine the fire and also permit men to get around the fire quickly.

2. Be sure and have enough men on hand when you start a fire to control the fire should it threaten to spread beyond the slash.

3. Never start a fire in the morning unless you feel certain a strong wind will not arise. The best time to start a fire is after 4 o'clock in the afternoon on a calm day; if the weather is warm and the slash dry, all the better.

4. If the slash-area is surrounded by timber, start fire first on the leeward side if there is a breeze, or on the uphill side if on a slope. When the danger of fire spreading beyond the area to be burned is past, set fire on the windward side or at the base of the slope; also whenever possible take advantage of a breeze blowing away from green timber.

5. Burn over the area as quickly as possible. This can be done by starting fires in a large number of places.

6. Keep a watchman on the area burned until all fires are out. Cut down any snags which may be burning. All fires should be completely out before June 15th.

Experience has shown that slash can be burned safely at the cost of 5 to 20 cents an acre, and that this expense is fully repaid by the resulting added safety of the camps, equipment, and surrounding timber.

Investigations to Eliminate Wood Waste

It has been estimated that in converting logs into finished lumber and lumber products, the waste amounts to over 50 per cent. of the bulk of all trees cut for lumber. This is equivalent to an annual loss of from \$10 to \$15 for every man, woman and child in the country. At present it is impracticable from a financial standpoint to reduce this waste as there is no market for the tree tops, culls and weed-trees left in lumbering operations, and only a very limited one for the bark, slabs, sawdust, edgings and trimmings of milling operations. The Department of the Interior is recruiting the staff of its Forest Products Laboratories, recently established in connection with the Forestry Branch, with skilled mechanical and chemical engineers and by constant experimentation it is hoped to find a commercial use for these products.

The Laboratories, which are operated in connection with McGill University, contain the most complete equipment on the continent for making timber tests. It is planned to submit each Canadian wood to over a thousand tests in order to establish as complete tables of the mechanical properties of these woods as now exist for steel and concrete. When these tests are published, as accurate information as can

be obtained will be at hand with regard to such questions, for instance, as to how great a weight a wooden column of a particular species will stand without risk of breaking, how great a burden can be carried by a beam of a certain species of wood of given dimensions, and other similar questions.

Timber has often been shunned as a structural material because no reliable figures regarding its strength were available. When complete tests have been made it is regarded as certain that a demand will be created for some of Canada's tree species which are now left in the woods as valueless. Not the least important line of investigation will be to develop chemical methods for utilizing minor wood wastes. A large percentage of the small-sized waste wood can be utilized by the process known as "destructive distillation," but the machinery employed in this process is not very efficient. The manufacture of ethyl alcohol and producer gas from sawdust has already been proved feasible. In the securing as Superintendent of the Laboratories Mr. John S. Bates, B.A., B.Sc., one of the foremost authorities on wood-pulp manufacture in America, the Department has also ensured the development of this branch of wood utilization.

Team Track Switching—The Shipper's Rights

The refusal of some of the railroad companies in Canada to permit cars to be switched from connecting railway lines, for team track delivery, causes inconvenience to many shippers who are served by the Canadian Northern Railway. Cases are continually being reported where switching to a team track in Toronto is refused by the Canadian Pacific Railway, or the Grand Trunk Railway, from the Canadian Northern. Cars which have arrived on the C. N. R. are frequently subjected to great delay and uncertainty, causing heavy additional expense in order to get the lumber delivered. Producers who have only C. N. R. connections are thus greatly handicapped by their inability to reach important markets.

The fact of the matter is, that shippers have a definite right to require the railways to switch cars under such circumstances, but are not taking advantage of their privileges. According to a statement of the Dominion Board of Railway Commissioners (No. 19801.70) issued on April 8th, 1914, and written by the chief Commissioner, "a switching movement is provided for by tariff properly issued and filed. The companies cannot, under the terms of the Act, decline traffic properly

offered to them under these tariffs and within the terms of the tariffs, as I hold team tracks to be, until proper notice of cancellation has been given. As the cancellation of these tariffs will mean that the traffic will move at higher tolls, the result is that the cancellation cannot be effective until thirty days after its publication."

In other words, tariffs are now in effect, filed under the provisions of the Act, under which the railway companies are obliged to provide switching to team tracks from other railways, and in order to escape from this obligation the railways would have to file new tariffs cancelling the old ones, which could not be made effective until after the expiration of thirty days from the date of the issue of the cancelling tariff; during which time the shippers would have an opportunity of appealing to the Board against the cancelling tariff.

The Board's order dealing with this question is known as the general interswitching order and was issued on July 8th, 1908. It establishes certain tolls for interswitching generally, within certain limits. Commenting upon this order, the Chief Commissioner in his statement of April 8th last says:—"A further ruling was made on the

3rd of February, 1912, to the effect that the Interswitching Order deals only with the tolls payable, and was never intended to compel one railway to turn over its entire terminals to another or others. Notwithstanding the rulings of the past, the railway companies, as evidenced by the circular issued by the Canadian Pacific and already referred to, have at least in part carried on interswitching so as to include team track deliveries. There is no doubt that team tracks do constitute, as has in the past been found by the Board, terminals of the respective companies, and it well may be that the Commission should not enable one company to carry on its business by the use of the terminals of another, and that, if such a principle was adhered to, general business would suffer largely, as no company would be able to get the slightest advantage in putting in expensive modern terminals giving the shippers an advanced or accelerated service, if their facilities could be made use of by any other company." This feature of the question, the Chief Commissioner says is too large a question, in view of the considered judgments of the Board, to deal with at the present time.

Apparently therefore, the position as it stands to-day is that the railway companies are obliged, on account of the general interswitching order and its most recent interpretation by the Chief Commissioner, to provide for switching from one railway on to the team tracks of another, and until the Board may have taken up the whole matter and issued a new order, or may have passed upon some new tariff issued by the railway companies, shippers have a right to require such switching to be performed. The whole matter at present is apparently one of tolls, to be settled between the railway companies themselves.

The statement of the Chief Commissioner also makes note of the fact that the railway companies have been directed to furnish the Board with information as to cost of movement and the effect of an order which would include team tracks as well as private sidings. It may be taken for granted therefore that in the course of time, this whole question will be gone into by the Board and an order issued which will place it on a more satisfactory basis for all concerned.

Editorial Short Lengths for Busy Readers

Arrangements which are being made for advertising the lumbering industry in connection with the Pacific Coast Ad. Men's Convention at Vancouver this month are rapidly nearing completion. Lumbermen and others associated with the industry in different parts of British Columbia are supporting the scheme and co-operating extensively. A number of excellent films for moving pictures have already been secured, showing the mills in operation. Other films are being made showing interesting logging operations. These moving pictures, together with moving pictures of the procession to be held at Vancouver will be distributed all over the American and European continents.

Canadian trade commissioners in a number of countries are now gathering information regarding the timber and lumber trade, at the request of the Minister of Trade and Commerce. This request has been made as a result of suggestions put forth by Hon. W. R. Ross, Minister of Lands for British Columbia. Mr. H. R. MacMillan, Chief Forester for British Columbia, states that he anticipates good results from this harmonious co-operation on the part of the two governments. Mr. MacMillan also reports that the British Columbia Department of Lands is making arrangements to send to points where these commissioners are stationed—particularly Australia and New Zealand—exhibits of finished articles made from British Columbia timber. In this way it is hoped to demonstrate, at points where it will do the most good, that British Columbia timber is very suitable for all classes of heavy timber construction as well as for the finest manufactured work, and thus to secure a much larger market in these countries.

The present Timber Royalty Act of British Columbia is chiefly significant in that it makes provision for the basing of all timber royalties, subsequent to January 1, 1920, on the sale value of the timber cut, over and above an arbitrarily fixed price of \$18 per thousand feet board measure. The percentage taken by the Government of this prospective value-increase will be at first 25 per cent., gradually rising to 40 per cent. in the succeeding 25 years.

This is no new principle, for as early as 1889 the Dominion Government required from holders of timber limits in western Canada a royalty of 5 per cent. of the total sale value of the lumber cut, which value was to be based on the average price obtaining during the three months preceding the sale. But at that time the price of lumber was not sufficiently high to bring in any very large revenue on this percentage basis, so in 1898 the stumpage dues were changed to the fixed rate of 50 cents per thousand feet, board measure, which is the rate at present. Although the retention of the percentage royalty would have secured larger returns from this source with the steadily rising lumber prices, yet the principle of selling the timber at a widely advertised public auction ensures the obtaining, through the additional

bonus offered, practically the same price for the timber without the former inconvenience of constantly adjusting the stumpage dues.

As the competitive sale of timber by means of the bonus system is common throughout Canada, there is little likelihood that the Government does not secure a fair share of the present value of the timber sold, and by reserving the right to alter the stumpage dues as the price of lumber increases, a share in its future value is also ensured. In fact, in Ontario the after results of some sales go to prove that the government received more than its share.

It is expected by some of those engaged in the pulpwood business in Quebec, that the new Order in Council of the Quebec Government, prohibiting the export of pulpwood or undressed lumber from lands granted as subsidies to railways, as well as from the present Crown lands, will result in a radical change of plans on the part of various big American and Canadian syndicates. The far-reaching influence of the new law may be gathered from the fact that the Provincial Government has granted no fewer than 13,625,949 acres of land in subsidies to railway companies. Much of this is valuable timber lands, and big areas of it have been sold by the railway companies to various syndicates. These syndicates, being under the impression that they were buying freehold land, to do as they like with, are now somewhat surprised to be confronted with an embargo against the export of pulpwood or lumber, except in a manufactured state.

In the May 15th issue of the Canada Lumberman information was published in reply to an enquiry regarding silver spruce for use in the manufacture of aeroplanes. The National Aeroplane Company of Chicago, Ill., replying to an enquiry upon this subject report that they have received a letter from the Government Wood Laboratory in regard to this matter. The Government reports that "Silver Spruce," "Western Spruce" and "Oregon Spruce" all probably refer to Sitka Spruce (*Picea sitchensis*) which is the most important spruce found in the Pacific Northwest. They say that this is sometimes called "Tide-land Spruce." Although they have data on the strength, elasticity, density, etc., of several varieties of spruce, they have not as yet the same information with respect to "Sitka Spruce," which they will be able to obtain only during the coming winter.

In order to obtain silver spruce, the National Aeroplane Company suggest that the best way would be to get in touch with some wood expert on the Pacific Coast, say Vancouver or Portland. Their own experience they say, has taught them the advisability of not relying on regular lumber dealers for obtaining special aeroplane woods. After a long search last year for suitable white ash (*Fraxinus Americana*) they finally had it cut specially in Tennessee. They were obliged to pay \$500 a thousand feet, but report that they obtained a quality of wood which they do not think has ever been put into aeroplanes before.

The Reader's Viewpoint on Trade Topics

Eastern Markets for B.C. Products—The Scalper's Influence on Trade— Market Reports from Readers

B. C. Products in Eastern Markets

Editor Canada Lumberman:

Victoria, B.C.

The writer is directly associated with, and interested in the Genoa Bay Lumber Company, at whose mill the large Toronto order referred to in your recent article regarding the Panama Canal, is being manufactured for the Robert Dollar Company. We naturally are seeking a market for the side lumber produced while cutting the Toronto order, and have, therefore, been investigating the possibilities of the Atlantic Coast. Our investigations have led us to the conclusion that there is very little opening in that market for our common grades of the shorter lengths, and the ordinary flat grain clears which would have to come in direct competition with the products of the Atlantic coast mills. We believe that our only chance to do a profitable business is to supply classes of stock not easily produced by the eastern mills, such as E. G. Clears, long lengths of dimensions and long timbers. We also hope to dispose of some boards of the merchantable grade in that market.

By way of summing up, I would say that our chief advantage to be expected from the Canal will be the opportunity afforded our coast mills to send to the Atlantic seaboard classes of stock not now easily produced by eastern mills at a cost, while not prohibitive to the builder, yet high enough to give the mill a fair price, and the carrier a reasonable freight.

Your article under the heading "B. C. Fir and the Panama Canal," is very timely and a good statement of the situation, particularly that portion depreciating the efforts being made by some of our manufacturers to get into the eastern market by cutting prices. Such a course can have no other result than to destroy the possibility of doing any business on a profitable basis.—Cameron Lumber Company, Limited, J. O. Cameron, President.

Expects More Settled Trade Conditions in B. C.

Editor Canada Lumberman:

New Westminster, B.C., May 19th.

Judging from the volume of business which we are receiving, we feel that the demand at least, shows an improvement. Now as trade is a question of supply and demand, the time is not far hence when we will be able to receive a fair price for our commodity again.

A number of the mills are closed down here, and more are considering closing which, of course, means a curtailment of the supply, and I feel quite confident that we will receive a fairly good fall trade, and that by next year the lumber business here will get back to normal. There is also to be considered, the fact that the Panama Canal will be in shape to handle, at least some of the lumber traffic next year. This will probably mean that the rail trade will not be so flooded, and that every person will seek out, more or less, permanent channels for their output. The prospects are, that when business has settled down in its new channels British Columbia will never again be so badly upset as it has been for the past six months.—J. G. Robson.

The Scalper a Menace

Editor Canada Lumberman: The last clause in John Harrison & Sons article, in your issue of May 15th, page 29, gives a fair illustration of our ideas, but not nearly strong enough, as there are a great many people in Toronto and other places who call themselves Lumbermen, who could not possibly tell one kind of timber from another, and again they try to scalp some one who will give them an order and then try to get next to the manufacturer to fill the bill and never have one dollar invested. These men are what we consider an injury to the trade. They become conversant with terms, but if you would ask them to go out and inspect a mixed car or cargo we doubt very much if they could do so. Had we the time, we might go on and cite instances. Manufacturers could, if they would, tell you more than we can about this.

We aim to buy all our lumber direct from the mills, when, if any discrepancies occur, they can generally be adjusted.—Retailer.

No Snap to Business at Boston

Editor Canada Lumberman:

Boston, Mass., May 11th.

There is a moderate volume of trade in New England at present, but conditions are not very satisfactory. There is no snappy business and no one seems to want to buy much lumber ahead. It has been felt rather generally that there is likely to be a good supply of spruce this

year from the east and that prices are likely to suffer in mid-summer—this is often the case.

General business, as well as the lumber business, seems to be rather light and nobody seems to know exactly when to look for an improvement.

Southern pine and "roofers" have been selling at very low prices here, as well as other southern pine products. It is thought however, that they are at the bottom and cannot go lower.

On the whole, there is not much to be said. There seems to be no marked change in business. It goes along in a moderate way—Shepard & Morse Lumber Company.

Retail Trade Better Than The Average

Frank McLean, Brigden, Ont., May 18th.—The lumber trade in this district has all the appearances of enjoying a good year, and in some lines the outlook is for a trade considerably better than the average. This is the case especially in regard to silo stock. The prices that farmers have been securing for their cattle for some time back are beginning to have a good effect upon business. Instead of selling calves at from one to three dollars each, the farmers are now keeping them until they are three years old and getting from eighty to one hundred and twenty dollars each. Every farmer who is doing this has a large barn with stables in the basement and a silo close by. Nearly every farmer who has not such a set of buildings is figuring on putting them up just as soon as he can. The price of cattle is making it possible for quite a number to do this, this season, and hundreds will follow in the near future. This district has developed into a good corn producer, and where corn will grow well, silos are sure to be in good demand.

There is also a good sale for cedar posts and shingles. The rail fences are coming to the end of their life in great numbers, and as there is no more rail timber available, wire and cedar posts are being used.

Shingles are also more used now for roofing old buildings than they were a few years ago. There was a time when most men thought, that some of the felt roofing was good enough for roofing an old building, but they seem to be mostly going back to shingles now.

A considerable quantity of lumber is also produced in this district in slack cooperage. There will be at least from six to ten million staves, with possibly heading and hoops to match produced this season. There is also some white oak in this district still, and a quantity also suitable for piles.

Market Dull in Bruce County

T. F. Mullin, Chepstow, Ont., May 18th: Really marketable lumber in this district is dull; in fact there is none offered. During the heavy wind storm that swept this country a year ago a great amount of timber was blown down which could not be cleared out entirely last fall and winter. This afforded an opportunity for four or five extensive manufacturers to buy up the large amounts of surplus stock produced, a supply sufficient for some years to come.

The scarcity of bush and the high price offered for logs by large manufacturers have combined to force the mill man to satisfy himself with custom selling, or else close up his business. The farmer will not cut down or offer for sale his limited amount of bush unless he gets a large price for it. This supply is readily purchased by the large manufacturers and as a result there is no lumber stock to export from this part of Bruce County.

Outlook Bright at Berlin

H. J. Hall & Son, Berlin, Ont., May 18th: We are quite busy in our line (although the furniture trade is very dull), and the outlook for this year seems very bright. Wholesale lumber travellers who may be reporting that trade being slow have no doubt found that the retail yards are stocked up, which is the case with us. We are therefore buying very little.

Trade Quiet at Brantford

The Schultz Brothers Company, Limited, Brantford, Ont., May 16th: Building in Brantford has been very quiet this spring. Our planing mill is only operating forty-four hours per week. Our brick yard has not yet started operation, but we have practically cleaned out the stock carried over from last fall, and expect to be operating

again next week. There has been a very fair demand for brick from out of town, but locally the demand has been rather quiet.

The box business is very quiet. This is due in a great measure to the fact that the canners are in such bad shape and it seems almost impossible to get any box orders from them.

The principal amount of the building that is being done consists of residences, there being very few factory extensions.

Dresden Trade Better Than Last Year

Laird Bros., Dresden, Ont., May 18th: Editor Canada Lumberman: Our trade has been in excess by a considerable amount of that of last year, during the first four months of each, and we are not looking for any slackening off in trade. The heavy rains we have had in this section for the last four weeks may put a stop to certain work, but we think the year will compare favorably with the previous year.

There is a tendency on the part of certain trades to make inroads upon the lumber business, but there will always be a place for quantities of lumber in any building. We think possibly the quiet trade reported by wholesale travellers could be overcome, but we have not the time to discuss these matters to their benefit.

Reports Upon Driving Conditions

A report from St. John, N.B., states that Mr. J. H. Hickman of Dorchester was unusually successful this year in getting out his drives. The cut was about 5,000,000 feet, a larger quantity than usual and the logs have all been brought out. Usually his drives occupy 15 or 20 days, but this spring he managed to complete it in 6 days. There was sufficient water to fill the streams, but not enough to overflow the meadows.

Latest reports also indicate satisfactory results in connection with the Miramichi drives and those on the Upper St. John and its tributaries.

Gilmour & Hughson, Hull, Que., May 13th: Driving conditions seem very bad for getting out logs. Our reports from our creek drives are very discouraging, and it is almost assured that if we do not get rains very shortly most of the logs in and on the Gatineau will be stuck. Rains coming later may help to some extent, but will not be the same as if we had them now.

August Herron, Barry's Bay, Ont., May 15th: Driving conditions have been good in this district and there has been sufficient water. The cut is considerably larger than it was a year ago, but I understand that it will all be taken out.

Booth & Shannon, Biscotasing, Ont., May 14th: We do not anticipate any trouble whatever from low water on our drive here. We have enormous water reserves, which practically allow us to take down our logs at any period of the spring or summer.

New Ontario Colonization Company, Jacksonboro, Ont., May 14th: We do not think that the low water will affect us in this particular part of the country. The water, however, in the streams up here is not as high as it was a year ago.

The J. D. McLaughlin Company, Limited, had about 25,000,000 feet of logs in the drives in Three Brooks and Trout Brook, N.B., this spring. These were brought out safely.

National Hardwood Convention Arrangements

At the annual meeting of the National Hardwood Lumber Association, which will be held in Buffalo on June 18th and 19th, one of the interesting entertainment features will be a special trip to Niagara Falls. At 2 p.m. on June 18th, members and guests will board special traction cars which will be in waiting at convention headquarters. These cars will proceed to Niagara Falls and convey the party to all points of interest between Niagara Falls and Lewiston on the United States side and Niagara Falls and Brock's Monument on the Canadian side. Dinner will be served at the New Clifton Hotel on the Canadian side, and after dinner the party will return to Buffalo at about 9.30 p.m.

The National Hardwood Lumber Association has a number of Canadian members, among whom the following are included:—Glen-gary Lumber Company, Berlin; Long Lumber Company, Hamilton; Hamilton Bros., Holland Centre, Ont.; Seaman, Kent Company, Limited, Meaford; Geo. C. Goodfellow, Montreal; Standard Mills, Limited, Montreal; John Harrison & Sons Company, Limited, Owen Sound; Keenan Bros., Limited, Owen Sound; Edward L. Casey, Sudbury; Quincy Adams Lumber Company, Limited, Toronto; C. G. Anderson Lumber Company, Toronto; Atlantic Lumber Company, Toronto; Robert Burry & Company, Toronto; Canada Lumber Company, Limited, Toronto; Edward Clark & Sons, Toronto; Graves Bigwood & Company, Toronto; Johnston Lumber Company, Toronto; R. Laidlaw Lumber Company, Limited, Toronto; Wm. Laking Lumber Company, Toronto; Mickle, Dymont & Son, Toronto; Oliver Lumber Company, Limited, Toronto; Spears & Lauder, Toronto; Wilson Lumber Company, Limited, Toronto.

It is expected that quite a number of representatives of these firms will be present at the convention. The influence of the Association in Canada is steadily spreading. Any hardwood lumbermen who may not have already joined will be welcome if they attend the convention, and may be assured in advance of having a most enjoyable and profitable visit.

National Wholesalers' Committees

The report of the proceedings of the 22nd annual meeting of the National Wholesale Lumber Dealers' Association which was held at Buffalo, N.Y., on March 4th and 5th has been published in attractive book form and sent to the members of the Association. The report contains all the speeches, addresses and special reports presented at the meeting. It also contains the list of committees for the current year which have since been appointed. The Canadian members included on these committees are as follows:—Board of managers of Bureau of Information, Duncan McLaren, Union Lumber Company, Limited, Toronto; Railroad and Transportation Committee, A. H. Campbell, Campbell, McLaurin Lumber Company, Limited, Montreal, P.Q.; Coastwise Insurance Committee, Angus McLean, Bathurst Lumber Company, Limited, Bathurst, N.B.; Forestry Committee, J. S. Gillies, Braeside, Ont.; J. B. White, Riordon Paper Company, Limited, Montreal, P.Q.; Membership Committee for Ontario, Quebec and Maritime Provinces:—Duncan McLaren, Chairman, Union Lumber Company, Limited, Toronto; Walter Laidlaw, R. Laidlaw Lumber Company, Toronto; Philip Walker, Shepard & Morse Lumber Company, Ottawa; A. H. Campbell, Campbell, McLaurin Lumber Company, Montreal, P.Q.; W. T. Mason, Mason, Gordon & Company, Montreal, P.Q.; W. G. Power, River Ouelle Pulp and Lumber Company, St. Pacome, P.Q.; and Angus McLean, Bathurst Lumber Company, Bathurst Village, N.B. Special Committee on Workmen's Compensation, C. Jackson Booth, Ottawa.

Woodworking Costs

Editor Canada Lumberman:

Hamilton, May 12th.

We have read the article which appeared in the Canada Lumberman of May 1st upon "Cost Accounting in Woodworking Plants" written by Mr. Jonas Howe. This appears to be a practical and effective system for getting at the cost of a "job" in a woodworking plant. The graphic time card is an excellent idea as its simplicity prevents mistakes by the operator and his whole time is accounted for at a glance. The cost card is very compact and affords a ready means of indexing the jobs for future reference. The idea of keeping the time of the different employees engaged on one order on the back of the card adds greatly to its value.

It might be interesting to know how Mr. Howe provides for keeping track of the cost of a line of goods like doors or sash, of which large quantities are made up for stock. Does he find the cost of each size separately or group them, having closely related sizes in the same group? How does he pay the employees working on such stock orders, at a rate per hour or by the piece? Has he any effective system to suggest for keeping the time on stock material by piece work, so as to increase the product at a reduced cost?—The M. Brennen & Sons Manufacturing Company, Limited.

Mr. Howe, writer of the article under discussion states that, in getting at the cost of a line of goods such as doors or sash which are made up in large quantities for stock, it is necessary to get the cost of the group, and from that arrive at a unit cost per piece or per article. He has had no experience with piece work, having been only in plants where the wages were paid upon the basis of time. The system which he has worked out could be applied, however, to piece work. In putting a certain class of work upon a piece work basis, it would be necessary to apply the cost card principle, as outlined in his article, for a few months. From the information thus secured one would have a good guide for arriving at piece work prices.

A Lumber Salesman's Bravery

News recently received from New Brighton, Liverpool, England, tells of the heroic act of Mr. Robert W. Brown, a brother of Mr. H. Brown, Jr., travelling salesman in Ontario for the Atlantic Lumber Company of Toronto. Mr. Robert W. Brown, who is a son of Mr. H. Brown, timber merchant, Liverpool, England, recently risked his life by diving into the water and bringing out an injured workman who had fallen from a crane driver, working on the dock. The unfortunate man struck the dock, injuring his head and fell into the water. He was unable to help himself and Mr. Brown, who is a timber salesman, immediately went to his assistance and ultimately got him to shore. Unfortunately, the man was so injured by his fall that he succumbed shortly after reaching the hospital. Mr. Brown's bravery has been highly commended by all who know him and it has already been suggested that it should be acknowledged by the recognized authorities.

C. S. Rollins, Coe Hill, Ont., May 16th: The usual quantity of lumber has been delivered at this station during the past season. The prices now being paid for all kinds of lumber, except hemlock, are the same as they were last year. Buyers are offering \$2 less for hemlock. The turn over is small at the reduced price.

Portable Sawing in Nova Scotia Woods

Sable Lumber Company's Operations in Queens and Shelburne Counties—Five Mills Sending out Their Product by Railroad

R. S. Webb—General Manager.

The portable mill system of conducting lumbering operations, which has been brought to a high state of development in the New England States, is being applied in a very interesting manner by the Sable Lumber Company, Limited, who own some 51,000 acres of timberland in Queens and Shelburne Counties in the province of Nova Scotia. The Sable Lumber Company, Limited, is owned by New England investors who, after studying the various methods of operating in Nova Scotia, decided to make use of this system as being the most suitable for the conditions to be met with in the limits which they own.

Lumbering by portable mills under such conditions is preeminently a railroad proposition. The Sable Lumber Company operates

the Queens County Railroad, with 27 miles of track, two locomotives and 65 cars. This railroad connects with the Halifax and South Western Railroad at Wilkins Siding where the Nova Scotia headquarters of the Sable Lumber Company are located. The main line of the Queens County Railroad runs north from Wilkins Siding towards the back portion of the company's holdings. From this main line, spurs are laid into the woods and a portable mill is set up on each spur. A picture of one of these portable mills is shown in one of the accompanying illustrations. At these mills, the lumber is loaded directly on to the cars from the saw, and is taken to Wilkins where the edging mill and "sticking" ground are located. The boards, as they come from the saw, are sorted on to the cars in loading. Those which are suitable for square edge stock are placed on one car and those which are suitable only for box boards are placed upon another. These are hauled directly to the sticking ground and stocked as shown in another illustration.

Five of these portable mills are operated by the Sable Lumber Company in the woods. Four of them are continually cutting and one is continually moving and setting up. All the moving of the camps is carried on by rail. Sleeping bunks, cook houses, and stable are built of such a size that they can be loaded upon a flat car. This work is so systematized that it can easily be handled in one day for one mill.

The portable mill system permits logs which are cut in the woods to be manufactured into lumber and reach the sticking grounds upon the same day. Wooden sleds with wooden shoes, known as "scoots" in New England, are used for hauling the cut-up logs from the stump to the mill. By using these scoots, in connection with the railroad, the company's manufacturing operations are conducted as easily, and fully as cheaply on bare ground, as on snow. Both oxen and horses are used in these operations, the latter being far the better for summer work.

The sticking ground at Wilkins is about a mile long, with three

tracks running through it. The edging mill is located at the upper end of the sticking ground. The square edge boards are laid directly on to small cars and taken by horse power to the sticking ground shown in another of the illustrations.

One of the accompanying illustrations shows a cutting-up mill which is operated at Wilkins. In this mill the box boards are cut to suitable lengths, edged and stored for shipment in the storage building shown in one of the illustrations. At the sticking ground the boards are loaded on tram cars which hold about 2,000 feet and are hauled to the mill by one horse. Four tracks run into the mill the length of one car, and four railway cut-off saws are located in such a manner that the operators handle the boards from the cars to the saw and put the cut stock upon trucks which carry it to seven edging saws. From thence the stock is taken to the store house which has a capacity of 2,000,000 feet.

From October 1st, 1913, to May 1st, 1914, the cut of the Sable Lumber Company amounted to 8,000,000 feet. The larger part of the stock is used by a large shoe manufacturing concern, being made into cases for their output. The balance of the stock is sold in England and New England.

Mr. R. S. Webb, general manager of the company, was form-

G. R. Webb, Assistant Manager.

erly interested in the manufacture of lumber in the State of Maine. Mr. G. R. Webb, assistant manager, had seven years' training in the Maine woods before engaging with the Sable Lumber Company.

One of the illustrations accompanying this article is a plan, from which readers may obtain an excellent idea of the way in which the cut-up mill, storage building and other buildings connected with the operations at Wilkins are laid out.

Tail End of a Portable Mill.

The Straight-Edging Rip Saw

There is no line of woodworking machinery in which there has been more striking recent development than in power-feed rip saws, and this development holds interest for both the manufacturer and consumer of hardwood lumber. There are not only types of these new machines that are interesting to the furniture manufacturer and to other users of hardwood lumber, but some of them hold particular interest also for the manufacturer of hardwood lumber, says Hardwood Record. There has always been a use for the rip saw in the hardwood lumber mill, but the most extensive use of such saws has been found in what the trade terms edgers—single side edgers and gang edgers. Rip saws have been used to some extent on the side for making small dimension stock, but have never been considered as factors in reducing the regular manufactured stock to square edges and to usable form. The old rip saw known as such, whether power feed or hand feed, was not considered a straight edging machine within itself, and for straight sawing the use of a fence was resorted to, which of itself really presumes upon one straight edge being already on the stock to be sawed to dimensions.

Among the new types of power feed rip saws some are now offered with the saw swung above the work between two feeding rolls and the work carried on an endless chain in the bed below. This style is featured as a straight-edging type, the claim being made that it will take many-edged stock or any other stock and rip it to a straight line without fence or guard.

This new idea in circular rip saws seems to be really a development from the sharp competition between the band rip-sawing machines and circular rip saws. The band saw type was the first to use the chain or endless bed type of feed, and it made such inroads in the field of rip-saw work that the makers of circular saw machines had to bestir themselves, and out of it all has come some new offerings with a combination of chain and roller feeds that should prove interesting and valuable additions to the machinery list for working hardwoods of various kinds in the modern sawmill.

The straight-edging rip saw offers possibilities both as an edger and as a machine for reworking lumber and making special dimension stock. It has not the capacity nor will it take the place of the gang edger in some mills and do a wider range of work in shorter time with less expenditure of elbow grease on the part of the operator.

Another important use that may be found for this same type of machine is in the assembling and wholesale hardwood yards where a

Storage Building of Sable Lumber Company—Wilkins, N. S.

certain amount of trimming and reworking of stock is essential to fill orders satisfactorily and to get full value out of the material. With electric current available in almost all cities and manufacturing centers, it is a comparatively easy thing to take a machine of this kind, set it up in the most convenient place for getting material to and from it and to connect it up with a motor. This convenience of the electric drive is leading to the use of a number of machines about the lumber yard that in times gone by were impractical because of the fire hazard involved in power producing and investment necessary for power plant equipment. To those adding machinery to help out the yard equipment this straight-edging rip saw seems worthy of special attention.

Whether willingly or unwillingly, both sawmill men and wholesale yard men in the hardwood trade are finding themselves getting more and more into the special dimension business, because the consuming trade is demanding more dimension stock and because it is the logical way to a proper utilization of raw material. That is one of the reasons why some of the new offerings in power feed rip saws are of special interest to manufacturers of hardwood lumber as well as to the consuming trade. They may not fit into every need or serve every purpose, but they do give promise of filling an important place and are certainly deserving of attention and study.

It is expected that the Elk Lake branch of the Temiskaming & Northern Ontario Railway will be extended to Gowganda and Sudbury. A large deputation from the Temiskaming, Sudbury and Nipissing districts waited upon the Ontario Government last week asking for the immediate extension of the road, and provision has been made in the estimates for going ahead with the work. The new road will tap a richly wooded country in spruce and other pulp woods, and at Sudbury will have a working connection with western lines.

The lumber industry in the United States employs 735,000 people, to whom are paid annually \$367,000,000 in wages, the worth of products being \$1,250,000,000. The forests of the country cover 550,000,000 acres.

Last year the fire loss on the Canadian timber reserves was the smallest ever known, only one-fiftieth of one per cent. of the area being burned over.

Sticking yard for Square Edge lumber, Sable Lumber Company.

Sticking yard for Round Edge box boards, Sable Lumber Company.

able waste of material. Under such conditions the men will help themselves usually to 50 or 100 per cent. more of material than is required, with a view to saving steps in going after more. Whatever is not used at the time is frequently allowed to lie around. Possibly it will be lost or carried off.

With a Store and a clerk in charge every workman knows exactly where he must go whenever he requires raw material. A Factory Requisition Slip (form 7) is used in this connection, and is handed by the workman to the store clerk and the goods are delivered at once, thus eliminating this source of wasted time and material. The requisition is checked and transferred to the cost clerk who posts the raw material items on the cost cards. All mouldings and length stock which is required for certain classes of work may also be considered as store material and handled in a similar manner. Every line of raw material on hand is represented by a Record Card (form 8). With these record cards the quantities of material on hand must balance at the end of a period.

Forms 6 and 7 are finally transferred to the cost clerk who ascertains the quantities and costs of all the raw material used. The direct costs thus ascertained are charged to the various jobs going through and the indirect costs are charged to the department or location where the material is used.

In the third article of this series the subject to be discussed will be indirect labor and material. We expect to be able to publish it in the issue of July 15th.

Dry Weather Gives Forest Fires a Start

The exceptionally dry weather which prevailed throughout Northern Ontario during the second and third week of May resulted in the starting of a number of forest fires, which threatened to assume serious proportions. In many places in the Ottawa Valley, recent reports stated that, unless rain came very soon, a number of villages along the Pontiac line north of Hull would be in danger of destruction. All the fire rangers employed by the railways, lumbermen's associations and the Conservation Commission were combining to fight the flames.

Serious fires were reported east, north and west of the Grand Trunk Railway's Highland Inn, Algonquin Park.

Reports from Huntsville stated that fires seemed to be raging in nearly every direction. The Axe Lake mill of the Muskoka Wood Manufacturing Company, Huntsville, was totally destroyed by fire and gangs of men were fighting against the flames which threatened the company's camps. In the neighborhood of Sand Lake a forest fire was threatening an important summer resort district. In the townships of Stisted and Chaffey the fires were threatening very heavy losses to the inhabitants.

A report from Sault Ste. Marie, Ont., tells of one fatality already having occurred, resulting in the death of a young girl who was suffocated by smoke.

Fires on Sugar, St. Joseph and Drummond Islands in the Georgian Bay were impeding navigation on the inside channel, according to reports received on May 20th.

At Escanaba, Mich., fires were reported in every direction within a forty-mile radius.

Alvin Thompson's tie and timber camps in Gorham Township, Ont., were destroyed by fire, according to a recent report from Port Arthur, Ont. Mr. Thompson's sawmill was saved with great difficulty. A large number of other fires were reported from various parts of the northern country and everybody was looking forward with great anxiety, and hoping that a plentiful rain fall would come in the near future.

Bush Fires Near Vancouver

A despatch from Vancouver, B.C., dated May 22nd says: "During last night and this morning damage of not less than \$100,000 had been done by bush fires within 20 miles of Vancouver. Dry weather for weeks has made the forests like tinder, and so numerous are the outbreaks that a great pall of smoke hangs over the city this morning. This is the hottest day of the season so far and there is no rain in sight. The most serious blaze appears to be at North Vancouver, where there is a great blaze running up Lynn Valley and sweeping along the sides of Grouse Mountain. Besides a shingle mill, eight cottages have been burned, and there are forty more in the path of the blaze. A special steamer, with government fire-fighters aboard, this morning left for Sliamon, a short distance up the coast to back-fire a blaze that has got into the timber.

Forest Fire Season Gets Early Start in U. S.

The first reports of forest fires have begun to come in to Washington from the national forests and they indicate to the federal officers an early start of the fire season, with unfavorable weather conditions from the very beginning. In the north-west there was less

snow on the mountains at the end of the winter than for many years past. Railroad rights of way which were last year deep in snow are reported clear now and dry enough to burn readily. From the Canadian border to Mexico the reports are similar, and there have already been extensive fires in California and Arizona.

The chief forester reports, however, that the fire-fighting forces of the service are organized better than ever before, particularly in respect to the fire detection system of lookout stations. By means of these stations fires are reported quickly and accurately, so that the control forces may be on the ground at the earliest possible moment. In those states where the gravest danger threatens, especial efforts are being made by the government foresters and by co-operative fire protection associations organized among timberland owners, to secure care with fire on the part of campers, prospectors, loggers, and by railroads. The northwestern forestry and conservation association, with headquarters at Portland, Oregon, is one of the leaders in this campaign.

Bad Lumber Fire at Cleveland, Ohio

A serious fire at Cleveland, Ohio, on May 25th, is reported to have wiped out one million dollars' worth of lumber belonging to the Fisher & Wilson Lumber Company. The yards of Martin & Barress are also reported to have been destroyed, also a large amount of property in the adjoining neighborhood.

Expects Higher Prices for Pulpwood

Mr. R. Chadwick, of the firm of Chadwick & Taylor, of the Ord-sall Hall Paper Mills, Salford, Manchester, one of the largest firms of newspaper manufacturers in Great Britain, has recently completed an eighteen months' trip through Canada and the United States, inspecting the various pulp mills and getting information regarding the supply and quality of Canadian pulpwood. In an interview Mr. Chadwick stated:—"The price of pulpwood is bound to increase in the near future, because the limits are getting further away from the mills and it will cost more to bring the timber down to the mills, for the lumbermen will not take on a contract at the old price if their camp is far away from the plant. They have to pay extra for provisions, and there is a heavier cost of transport. At present the mills are paying five and a half to six dollars a thousand feet of wood delivered at the mill from within a radius of twenty miles, and I feel sure the price will go up slowly as the consumption increases. It is true there is a great deal of pulp on hand at present, which has to be cleared out and that will postpone the rise, but it is inevitable in the near future."

Messrs. Chadwick and Taylor have recently completed a seven-year contract for Canadian pulp with a mill at Chicoutimi, P.Q., and now have a contract for a shorter term. They find that Canadian pulp is well suited for the production of the ordinary news print paper used in England.

Transatlantic Lumber Charter Forms

"It is quite nine months since the Documentary Committee of the Chamber of Shipping had suggested to it the necessity of drawing up a reasonable form of charter for the Canadian lumber trade," says "Timber," of London, Eng. In the autumn of last year several steamship owners regularly engaged in this trade were approached for their views on the forms of charter in use, and freely gave them, but so far nothing has apparently been done by the committee. "Already quite a number of fixtures have been arranged for the coming season on the basis of the merchants' form of charter, known as Canconform A. Not content, however, with this favorable document, says the Shipping Gazette, some merchants have devised a new form, called Canform B, which stipulates further clauses in their own interests, and very much against those of owners. Thus the second part of discharge, when two are granted, need not be declared until the vessel has discharged at the first port; the arbitration clause is erased; and a strike and detention clause is inserted which covers shippers against anything that may happen.

"It seems evident that, unless the Chamber of Shipping makes a move in the matter of fitting up a form of charter, the present objectionable forms will grow more objectionable still, as shipowners individually cannot well stand out against clauses in the charter. It must be done collectively to be effective, and the longer the matter is deferred the greater number of objectionable clauses there will be to fight against.

"Surely, says our contemporary, the Canadian lumber trade is still important enough to deserve the attention of the Chamber of Shipping, and this notwithstanding that it is year by year decreasing in magnitude, owing to the fact that the lumber on the eastern side of Canada is fast being used up, and the future timber reserves will be those of the western portion of Canada, as well as those of Japan and Manchuria."

Hemlock Men Discuss the Situation

**Trade Conditions in a Mixed State—Stocks Very Light—
Imported Stock Selling Extensively**

An interesting meeting of Ontario Hemlock manufacturers was held at the Queens Hotel, Toronto, on May 27th. The principal subject of discussion was the trade situation in connection with hemlock in Ontario. This subject was discussed from every point of view and the discussion showed that stocks of dry hemlock to-day are practically out of existence; also that the consumption of hemlock is quite extensive, especially in the large cities, but that the competition of Wisconsin and Michigan hemlock is a very important factor in connection with the trade. Were it not for the importation of these stocks from the United States, it was considered certain that Canadian producers would not be able to handle the volume of trade that is offering. Higher cost of production was reported this year than last year. Most of the manufacturers are getting out their drives successfully. Although there is a feeling of uncertainty as to the immediate future of the market, none of those who attended the meeting were apprehensive of any difficulty in disposing of their stock at a fair profit. Prices of hemlock to-day are probably about a dollar or a dollar and a half lower than they were a year ago, but the manufacturers were of the opinion that there would not be serious difficulty in disposing of this year's cut at such prices.

The meeting was called to order by Mr. W. W. Carter, Toronto, who spoke of the large amount of American hemlock coming into Ontario. The chief trouble however, in Ontario to-day, was to get sufficient dry stock. Wisconsin and Michigan were turning out enormous quantities of hemlock and sending much of it to Ontario, with the result that the Ontario manufacturers were feeling the competition rather severely. He believed that the Canadian manufacturers would have to face this situation for some time. Trade conditions in the States were still unsatisfactory and the consumption of lumber was not enough to keep the manufacturers from shipping heavily into Canada. Until things brightened up in the States and the railroads commenced buying lumber again, no improvement could be expected. The United States mills making Southern pine were marketing great quantities, in order to pay interest on their bonds and they were obliged to sell stock even at a loss.

Mr. Carter also drew attention to the recent law suit in Montreal, as a result of short leaf (loblolly) Southern pine being put into a building where long leaf was called for. This lumber rotted after a year and steel had to be put in its place. The law suit resulted in a verdict of \$71,000 against the contractors. The same class of stock was coming on to the Ontario market and many consumers knew so little about it that they often bought it.

Mr. Norman Hocken, Otter Lake Station, drew attention to the widespread nature of the trade depression. Conditions in Canada were probably not 50 per cent. as bad as they were in the United States and other countries. During the past two years hemlock manufacturers in Ontario had done fairly well. To-day however, their cost of production was so much higher that prices could not be put back to where they were a few years ago. They were going much further back for their timber now than they used to. The standing hemlock timber to-day was probably not more than 50 per cent. of what it was 12 years ago.

For dry stock to-day \$20 could be had. For new stock they were able to get \$19.

Mr. Hocken thought it was a good thing for the trade that the United States stock was coming in. Ontario mills could not take care of the trade if none of the United States stock were coming in.

Mr. J. D. Shier, Bracebridge, Ont., said that No. 1 hemlock was not going very fast. No. 2, was selling all right. Lath were going all right. Prices were down a little as compared with a year ago. He had had no dry lumber to put on the market this spring. He now had about 2,000,000 feet. The weather this spring had been very good for sawing. His mill was running double shift. Possibly after another month they might reduce to a single shift. He had taken out a good cut of logs, but logs had cost about 50 cts. more than formerly. The prices of hemlock lumber would probably be from a dollar to a dollar and a half lower this year than a year ago. One of the troubles now, was that they were paying too much for their raw material. The tanneries were not using as much bark as formerly. When hemlock got up to \$3, \$4 or \$5 on the stump it was too high. Of course, when business was good it was different, but trade was quiet now and this was the time of year when it ought to be good. He was more and more coming to the opinion that the manufacturer ought to go on the road and sell without the assistance of the wholesaler. It was advisable however, so far as possible, to keep the good will of the wholesalers, but he did not intend to lie down and let his piles of lumber grow.

Mr. Carter agreed with this and added that, even with the assistance of the wholesaler they could not have prevented the present

conditions from developing. The wholesalers had not brought them about. The Americans had invaded the market so as to keep trade moving. Ontario manufacturers could meet the competition, and they had the advantage of being able to make quicker delivery. None of the United States stock would come in, if there were enough dry Ontario stock for the trade. Mr. Carter believed in keeping on as good terms as possible with the wholesalers.

Mr. Hocken said they had been sawing since January, and had made 3,500,000 feet of hemlock and they did not own to-day a quarter of a million feet, so close had they been selling to the saw.

Mr. Charles McGibbon, Penetanguishene, Ont., said that he did not see any sense in dropping prices, when nobody had any stock. No money could be made in selling at \$18.50. The stock produced was less than a few years ago and the country was growing, so that there would be no need to lower prices. For twelve-foot stock they could get \$20 to-day, direct from the saw.

Mr. Kitchener, Bracebridge, believed that until the new cut came on the market it would be hard to say what the prices would be. American hemlock prices were governed by Georgia pine, while Georgia pine was dependent upon the demand of the railroads. Possibly the railroads would be buying lumber again before the Ontario stocks were on the market.

Mr. Geo. Tennant, Bracebridge, said he expected to manufacture about two million feet this year and was not worrying about it as yet. If he could not sell it this year he could next year. He had already sold his No. 2 stock.

Mr. Hocken said he believed that the cut this year was not much different from last year. It might be about ten per cent. larger.

Nova Scotia Has Alleged Timberland Scandal

A sensational charge was made in the House of Assembly at Halifax on May 20th by Mr. C. E. Tanner, leader of the Opposition, based upon affidavits from Clarence Mills and Ernest Mills, of Annapolis, charging that the Attorney General, Hon. O. T. Daniels, had wrongfully obtained from them as members of A. D. Mills & Sons, Limited, a mortgage on 75,000 acres of lands and also a note for \$75,000. The point of the charge is, that the mortgage and the note are alleged to have been obtained in consideration of putting through a deal for the Mills' firm, to enable them to issue certain bonds for the purchase of timberlands from the Halifax and Southwestern Railway. The lands were to be joined with the Mills' timberlands in Annapolis and the whole sold to a syndicate. This sale was never effected and an action was begun by A. D. Mills & Sons, Limited, which was settled out of court. A lengthy debate upon the subject took place in the Assembly. The government supporters claimed that the transaction was an entirely proper one, made in the interests of the province.

Ontario Pulp Wood Sales

Hon. W. H. Hearst, Minister of Lands, Forests and Mines for Ontario, is advertising for tenders for the right to cut wood of various descriptions on a certain area tributary to the Frederickhouse and Abitibi Rivers in the district of Temiskaming. Tenders are being received up to June 8, and all bidders are required to state the amount they are prepared to pay as bonus, in addition to the ordinary Crown dues, including forty cents per cord for spruce and twenty cents per cord for other pulp woods, or such other rates as may from time to time be fixed by the Ontario Government, for the right to operate wood products mills on or near the area referred to. Tenderers will also be required to erect a mill on the territory and to convert the raw material into finished products and to deposit a check for ten per cent. of the amount of their tender.

Robert Dollar Building a New Vessel

The Robert Dollar Steamship Company of San Francisco, are having a new steamer built on the Clyde for service in the lumber carrying trade from ports on the Northern Pacific Coast. The name of the new vessel will be the "Harold Dollar." The vessel will have a capacity for handling more than 5,000,000 feet of lumber. The Dollar Line already has eight vessels in its fleet. The company intend to use several of these steamers in transporting the greater part of 24,000,000 feet of Douglas fir timbers from Vancouver Island to a port on the Atlantic Coast, whence they will be transhipped by rail to Toronto to be used in the Toronto harbor works. The "Harold Dollar" will be operated under British Registry, with Victoria, B.C., as her home port, as is the case with the other vessels of the fleet.

Dean Adams, of McGill University, states that the Federal Government have decided on an extension of the Forest Products Laboratories. The chemical department, in connection with the pulp industry, is to be enlarged, and housed in the Molson Building, University Street, Montreal.

A Trouble Saver for Retail Yards

This plan for saving trouble in handling retail stock is so simple that it seems almost ridiculous to send it in, but I have found it such a time and trouble saver that I do not see how any yard agent can do without it.

I have seen fir and spruce finish chucked into the shed without any supports or separations for widths or lengths, the result is a continued mix-up with a loss of time in getting what you want when a customer calls for it, to say nothing about the looks and bad conditions of stock.

With this rack it is a pleasure both to receive and to deliver spruce

1X6-12 FT.	1X5-12 FT.	1X4-12 FT.	1X3-12 FT.
1X6-14 FT.	1X5-14 FT.	1X4-14 FT.	1X3-14 FT.
1X6-16 FT.	1X5-16 FT.	1X4-16 FT.	1X3-16 FT.

finish, or fir either, especially the narrow pieces which I recommend it for.

The accompanying diagram will give an idea of the plan and it is so simple that a mere suggestion of it is sufficient.

Take a stall in the shed and build in the above divisions with 12-in. to 14-in. vertical space for each bin, or rack, and make the width to suit the desired number of pieces of the different widths, say four to six.

Have at least three frames so that the 12 ft. lengths will be supported and kept together in shape.—G. F. Mills, Wilkie, Sask.

Fitting Light Band Saws

As the light band saw is coming in use more each year, the small mill and factory owners are always on the lookout for a man that can put up a saw that will stand heavy feed and cut straight lines, says a writer in the Woodworker, Indianapolis. In tensioning, the lighter the saw the more difficult and particular it becomes. One must be very careful to have the saw level near the front edge. This is most essential, for when it is dished or lumpy it will not run well, be you ever so careful in other things. I tension 5-in. saws to a segment of a 21 to 25-ft. circle, and 7-in. saws to a 35 to 39-ft. circle, with a little more tension in front half of blade. I use both the drop and lift of blade in tensioning, mostly the lift when looking for small fast or loose places, being very careful to not get extreme fast or loose places near front edge. I also carry a little longer back in light gage saws, for the reason that they expand very quickly with slight heat, which is bound to occur when cutting pitchy or wet lumber.

A 21-gage saw with 17-gage swage will stand up better and last longer than a 22 or 23-gage with the same swage, so it is of benefit to both the operator and filer. Should the lumber be wet or pitchy, it is work for the filer; one can get along quite nicely if the lumber is dry. I have fitted saws 7-in. wide, 21-gage, 1-in. space, with 17-gage swage, tensioning as before stated, and had them stand up and cut 12-in. lumber, 120-ft. per minute, for ten hours, day after day. This is no "hot air," but one has to be very careful in the fitting.

After swaging, shaping and grinding, I use the side file as usual, then take a good sharp 8-in. file and side-dress the saw by hand to get the right bevel or undercut to the teeth. The side file only gives one bevel—straight with saw and down narrower toward base of tooth—but the side filing by hand, when properly done, gives the back bevel so essential in running thin or light saws. I do not use this method on 19-gage or heavier saws, as the ordinary side file is sufficient.

The reason so many fail in the care of light saws is, they will not take the trouble above mentioned. The side-dressing of a thin saw is very delicate work and one must have the best of light. If you have not, use an electric light, placed so it reflects on back of tooth, or, better still, make a holder so it can be fastened to the head, same as a miner's lamp; then you can see the points of the teeth very plainly. One can get along providing he does not care how slowly the saw cuts, but when he has several band mills to file for, each cutting a large

quantity of lumber, the saws must be put up so they will stand very heavy feed, for hours at a time.

In tensioning to a 35-ft. circle the saw will become somewhat wavy and will not lie flat on the bench, but with a weight on it one can level quite nicely. The main thing is to not roll very heavily or hard in any one place. Distribute the rolling well, thereby making the tension even, and the saws will not crack, providing the mill is in good shape. I do not want any reader to think I do not get any cracks, for I have had them and still get them when putting up saws to a high tension for cutting wet lumber; but the cutting of lumber is what the company wants, and gets.

A good machine, well kept up, is essential, also a good machine man. It is not every man that can properly run a pair of 21-gage band saws on a horizontal or vertical band mill, on very fast feed. Pitchy and wet lumber causes about the only trouble one should have with a good machine and a good man. We cut just as much when the lumber is dry, with the 21 and 22-gage saws, as with the 19-gage. As to strain, I use the same on the 21 and 22-gage saws as the 19-gage. Of course, they stretch out a little more, but the filer is paid to do the work, and if one wants to make a success in any line he must not be afraid of work.

I have tried $1\frac{3}{4}$, $1\frac{1}{2}$, $1\frac{1}{4}$ and 1-in. spacing on 7-in. saws, and where the lumber is knotty and not over 12-in. wide (pine), the 1-in. spacing has given best results. This is on 21 and 22-gage saws only. The teeth do not get broken and they stand more feed. This, of course, depends on the kind of lumber; I refer to pine such as is used in making boxes.

Many filers have only one band saw grinder and have to turn a saw to right hand or left hand, as the case may be, to sharpen it. This is very easy to do alone, as follows: Standing in front of saw, with the teeth toward you, raise saw (the upper half), placing both arms underneath. Grasp back of saw with the hands (hands being about 3-ft. or more apart) and twist back of saw downward and toward you. It only takes a slight twist to do this, at the same time stepping backward. The teeth hold to the floor and keep saw from slipping. When a step or two has been taken, hold up on saw a little or it will turn too quickly. After you have the twist started, the weight of saw will do the rest. This takes only a few feet of floor space and is better than putting saw against the wall or having some one else help you.

Mixing Woods in Mill Work

We have an unfortunate habit of mixing the products of many different logs at the saw mill in grading and sorting out lumber. This makes it a little difficult at times to get exact harmony in color and texture of wood to be used on a job. It seems to be necessary in the present order of things, however, to scatter the product of the log instead of keeping it intact, as is done sometimes in the older countries. But even if this is necessary it is not a good excuse for some of the mixtures to be seen both in mill work and furniture.

Quite recently a saw mill man told of going into a new office building to make a call, and while waiting in the reception room he fell to taking stock of the mill work in the room and he was astonished at the results. He found one door casing of plain white oak and one of quartered white oak. In the work running around the room he found various mixtures of plain white and red oak, and quartered oak and chestnut.

Now, some planing mill probably had the job of getting out all of this finish, and it is very likely that the finish in different rooms was uniform as to size and pattern. It is hard to conceive of a planing mill getting out, either purposely or carelessly, the kind of mixture this man said he found in one room, had the mill been making the work for just that one room.

However that may be, the lack of regard for consistency evidently started at the planing mill. If the order called for quartered-oak trim the mill should have made it all of quartered oak, or if it was plain oak it should have been plain, and some effort made to get oak that would harmonize in texture and figure. Somebody, somewhere along the line should have sorted through that stock so as to get for at least the majority of the rooms in the building stock so assembled that it would blend harmoniously.

The instance cited here is not by any means an isolated case, but it illustrates a fault all too common in the woodworking industry today. It begins with the saw mill mixing lumber indiscriminately. This may be unavoidable, but at the planing mill, furniture factory or wherever the lumber is used, a little effort would make it possible to get stock for each job that would come something near working together harmoniously. We should keep this in mind and remember that discrimination in woodworking does not stop at requiring a higher order of skill on the part of workmen, and the better class of machinery for doing the work. It also includes a consideration of the material used, so as to avoid ugly contrasts and patch work appearances, and to get an order of consistency and harmony out of the finished product.—The Woodworker, Indianapolis.

Fine Equipment in New B.C. Sawmill

Electric Drive and Modern Machinery in Plant of Campbell River Lumber Company at White Rock

The new sawmill plant erected last summer by the Campbell River Lumber Company, Limited, of White Rock, is entitled to rank as one of the leading mills of British Columbia. Several other plants have a larger daily output, but when it comes to the cost of taking the logs from the water and manufacturing the lumber ready for shipment, it is surpassed by none. The company consists of H. W. Hunter, president, who is the mill manager; F. G. Fox, vice-president, who is manager of the logging operations; T. A. Hunter, treasurer, who is sales manager, with office at 905 Dominion Building, Vancouver, B.C.

Following the destruction by fire of the company's sawmill at Hazelmore, B.C., about a year before, the construction of the new mill was commenced at White Rock, where now stands one of the most complete electrically-driven mills that there is in the country to-day. The mill was erected in record time, construction having begun on April 17, 1913, and the first board being sawn on August 17 of the same year. The work was done under the supervision of H. C. Winston, the company's present sawmill foreman, and D. E. Rice, architect and mill builder, of Vancouver, B.C. Early in September everything in and about the plant was in first-class shape, the output being 100,000 feet daily.

Description of the Plant

The sawmill, which spans the narrow channel of the Campbell River, is 50 x 215 feet, three storeys, each 12 feet in height, and has a cupola roof. A wing or addition on the west side is 84 x 144 feet. The log haul is at the south end of the mill, facing the bay, the channel of the river at that point having been dredged out to hold a good supply of logs. The mill equipment comprises machinery supplied principally by the Allis-Chalmers Manufacturing Company, together with Sumner Iron Works set works, Stetson-Ross ready sizer, Puget Sound Machinery Depot's mechanical spotter, and an eight-foot Mershon band re-saw. The head-saw is operated by twin engines and the remainder of the mill is driven by electrical motors. Space has been reserved on the mill floor for a heavy duty Wickes gang, which is to be installed in the near future, and when in place will increase the daily output between 35,000 and 40,000 feet. Timbers pass from the saws to two timber decks at the rear of the mill, one holding two car loads in lengths up to 24 feet; the other one car load of long lengths, 24 feet and up. The means provided for the automatic handling of the entire cut, and the small number of men employed on the floor, as compared with the average mill, are features which arrest the attention of every visitor to the plant. The clear lumber is taken off the transfer chains and loaded direct on dry kiln trucks, the stock passing from the dry kilns to the planing mill without re-handling. Defective stock is removed from the sorting chains, re-manufactured by a small edger and trimmer housed in a building close by, and again placed on the chains.

The filing room, in the third storey, is 50 x 50 feet in size, and has the latest Covel equipment, furnished by the E. C. Atkins Saw Company. F. W. Norberry is in charge of this department.

Adjoining the sawmill, and convenient to the sorting table, is the lath mill, the capacity of which is 25,000 pieces daily, or its equivalent in shingle bands, for which there is a brisk demand.

The engine room, repair shop, and quarters of the plant electrician and steam engineer, are located on the ground floor, to the front.

A Chandler & Taylor 14 x 18-in. twin engine, generating 280 horse power, receives steam through a 7-in. pipe from three Vancouver Engineering Works 60-in. x 16-ft. boilers, with Dutch oven feeds, which are installed in a separate power house protected by a fireproof wall on the mill side. Behind the Chandler & Taylor engine is the switchboard controlling the electrical equipment throughout the plant, all of which was put in place by Thomas Campbell, mill electrician. The steam plant is looked after by C. J. Moffat, engineer.

Wehn the type of dry kiln came up for settlement, the vote was all one way—North Coast. Two of these popular kilns were installed, their united capacity being 50,000 feet of lumber per day. They are giving absolute satisfaction, the stock being turned out in perfect condition. Steam is supplied from the boiler room, 250 feet distant.

Planing Mill a Roomy Structure

The main planing mill is 100 x 100 feet, two storeys, with cupola roof. The machines already installed comprise two S. A. Woods planers and matchers, American Woodworking Company sticker, rip-saw and re-saw. Space has been reserved for several other machines, which will be placed later in the season. All equipment is electrically driven.

Adjoining the planing mill to the west is the rough clear lumber shed, 50 x 150 feet in size. It is equipped with tracks to receive the platform cars, so that no piece handling of stock is required.

The shed for finished stock is located near the planing mill. The building is 40 x 200 feet in size, and is filled with select grades of lumber carefully bundled and placed on end. At the west end of the shed, mouldings are stored in racks. Twenty-four cars can be placed along the loading platforms at one time when necessary.

Fire Risk Reduced to Minimum

The company has made ample provision against serious loss by fire. Two large capacity Fairbanks-Morse steam pumps, located south of the engine room, are fed by a 5-in. steam pipe direct from the boilers. The pumps are connected with 8-in. water mains reaching all buildings as well as the piling yard for common lumber, hydrants being placed at suitable points with lengths of 2½-in. hose close by. In addition the main buildings have been equipped with automatic sprinkler systems, by means of which any blaze occurring night or day will be flooded by overhead pipes, an electrically-operated alarm gong at the same time announcing the point of attack. The sprinkler systems are fed from a 40,000 gallon tank erected on a hill west of the steam pumps, the elevation of 100 feet assuring a high pressure at all times. In connection with the above fire-fighting apparatus, the company has provided for a complete system of fire drill; that is, at least once a week the fire signal is given and a very practical fire drill is carried out, thus assuring the company that the employees thoroughly understand the handling of the fire-fighting apparatus. These safeguards, taken in connection with the fact that there is a clear space of 150 feet between the mill building, dry kilns and planing mill, undoubtedly reduce the fire risk to a fine point, and the underwriters have therefore granted the company a very low insurance rate.

The Motors and Their Work

The motors installed throughout are Allis-Chalmers alternating

Plant of Campbell River Lumber Company, Limited, Semiahmoo Bay.

H. W. Hunter,
President and Secretary.

Frank G. Fox,
Vice-President.

current, 3-phase type, direct connected with three exceptions, the size and duty of those in the sawmill being as follows:—

- 65 h.p.—operating re-saw and live rolls.
- 50 h.p.—operating trimmer saw and live rolls.
- 50 h.p.—operating ready sizer machine.
- 30 h.p.—operating ready sizer fan (belted).
- 35 h.p.—operating lath mill equipment.
- 30 h.p.—operating cut-off saw and live rolls.
- 30 h.p.—operating two sets of live rolls.
- 20 h.p.—operating slab conveyor.
- 15 h.p.—operating turn table and sorting table.
- 15 h.p.—operating small edger and cut-off saw.
- 5 h.p.—operating blower for sawdust burner.
- 5 h.p.—operating filing room machinery.
- 75 h.p.—operating planer.
- 5 h.p.—operating two additional cut-off saws, belted.
- 75 h.p.—operating two planers.
- 75 h.p.—operating blower system, belted.
- 30 h.p.—operating sticker, re-saw and cut-off saw.
- 25 h.p.—operating turning lathe and conveyors, belted.
- 5 h.p.—operating grinding room equipment.

Some Interesting Notes

Part of the company's supply of fir and cedar logs comes from extensive limits at Crescent, not far from White Rock, where a camp of about fifty men operates both winter and summer. The logs are towed to the mill by the firm's gasoline tug, which can handle six or seven swifters in any ordinary weather. A second camp of about forty men is located on Little Valdez Island, about eighty miles up the Coast, the towing from which point is done under contract.

One of the factors instrumental in the selection of the Semiahmoo Bay site was the fact that the Great Northern main line from Vancouver to Seattle skirts the front of the reserve. A spur line capable of holding 25 or 30 cars was run into the mill property, from which

branch tracks extend to the timber decks, the planing mill, dry stock shed and piling yard. With a plentiful supply of cars at all times available for shipments north or south, backed by a mill that is equipped for the economical manufacturing of lumber, the company feels safe in asserting that its facilities are second to no other plant in British Columbia.

In addition to their output of lumber the Campbell River Lumber Company, Limited, has for several years been manufacturing shingles on a very large scale. They operate five shingle mills, located at the following points: White Rock, daily capacity 100,000; Melrose Spur, 60,000; Crescent, 60,000; Colebrook, 100,000; Cloverdale, 100,000. In their various operations a force of close on 300 men find steady and lucrative employment.

All the blowpipe work at the White Rock plant was done by the John K. Miller Company, Limited, of Vancouver. The contract was completed on time and the installation gave satisfaction from the starting of the fans.

Short ends from the planing mill machines are dropped into a car on the railway switch below, the fuel finding a ready market in Blaine. When a car is not in place, the short ends fall into a bin, which is emptied when a car is available.

The waste from the sawmill is consumed in the open, being deposited by conveyors at the back of a small hill, about 100 feet east of the mill. There is absolutely no danger of sparks being carried that distance, but a further safeguard is to be provided in the form of an iron shield along the mill side of the fire pit. At first the wet sawdust was deposited for burning with the slabs. This was found to be unsatisfactory, the sawdust filling the crevices and preventing free combustion. The difficulty was overcome by diverting the sawdust into a separate conveyor which empties over the discharge end of a pipe connected with a small fan, operated by a 5 h.p. motor. The plan solved the draft problem, and is recommended to all millmen who operate open burners.

Proposed Addition to Hardwood Rules

At the 17th Annual Convention of the National Hardwood Lumber Association which will be held at Buffalo, on June 18th and 19th a few additions will be proposed to the inspection rules. These additions have been recommended by the Inspection Rules Committee and are as follows:—

Plain sawn flitch lumber shall be graded according to the general rule applying to the kind of lumber inspected, with the exception that it must be measured on the narrow or sap side in the center of the piece between the wane or bark, and graded into any of the grades as No. 3 Common or Better, to which its quality entitles it. There is no restriction to heart in the grades of common. This rule does not apply to Veneer Flitch.

Wormy Beech shall be graded according to the rule for Beech No. 2 Common and Better, with the exception that pin worm holes shall not be considered a defect.

Annual Meeting of the Joseph Dixon Crucible Company

At the annual meeting of the stockholders of the Joseph Dixon Crucible Company, held at the company's main office in Jersey City, N.J., on Monday, April 20, 1914, the retiring Board of Directors, consisting of Geo. T. Smith, William Murray, George E. Long, Edward L. Young, William G. Bumsted, J. H. Schermerhorn and Harry Dailey, were unanimously re-elected. The meeting was attended by a large number of stockholders who expressed satisfaction with the present management and recorded the largest vote ever represented at an annual election, 9,628 out of a possible 10,000 shares being represented. The officers of the company, consisting of Geo. T. Smith, President; George E. Long, Vice-President; J. H. Schermerhorn, Treasurer; Harry Dailey, Secretary, and Albert Norris, Assistant Treasurer and Assistant Secretary, were also re-elected.

Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of April 9th, as follows:—Lumberstuffs.—White pine—There have been no arrivals in this class of lumber during the fortnight, but dealers' have sufficient stocks on hand to last them for some time to come. Spruce—the Trn. Schr. "Rosalie Belliveau" arrived on the 4th inst., to our address with 221 m. ft. which we had sold to arrive at \$26.50 for merchantable. This vessel also brought 21 m. ft. spruce scantling which we sold at \$25.00 and \$23.00 according to specification. Pitch pine—No arrivals, but stocks are sufficient for present requirements. Shingles—No receipts of either Gaspe or cedar laying, but we understand a couple of cargoes of the latter are expected. Shooks—No arrivals. Wood hoops—Receipts consist of 500 bbls. by the S.S. "Tyne" imported by a dealer.

View of planing mill.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

Wanted

One or two blocks of Spruce, also Pine, Must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-t.f.

Wanted

500,000 feet Hard Maple, 1½-in. to 4-in. Also 1-in. Basswood. Shipment Summer and Fall. Terms Cash. Box 32, Canada Lumberman, Toronto. 11-12

Wanted

1,000,000 ft. Spruce, 1-in., 1½-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-t.f.

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS,

7-12 Hamilton, Ont.

Wanted

Soft Elm, 4/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,

9-t.f. Board of Trade Building, Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. t.f.

Wanted—Large Quantities

1-in. x 5-in. and up No. 1 White Pine Mill Culls.
1½-in. x 5-in. and up No. 1 White Pine Mill Culls.

1½-in. and 1½-in. C. & B. White Pine. Quote prices and state amount for sale. Box 29, Canada Lumberman, Toronto. 11-12

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

For Sale-Lumber

For Sale

Quantity of first-class cheese box veneer.

G. R. JONES,

10-12 Eldorado, Ont.

For Sale

5,000 Cedar fence posts, 5-in. and up diameter and 8 ft. long. Average 6½ in. diameter. Grand lot at a bargain. Apply M. C. Neate Lumber Company, Cummings Bridge, Ont. 11

For Sale

200 M. ft. Hemlock, 1-in. and 2-in., all sizes and lengths.
70 M. ft. Hard Maple axles, dry Prime stock
50 M. ft. Soft Elm, 1-in.
25 M. ft. Soft Elm, 2-in.
25 M. ft. Soft Elm, 3-in.

Box 33, Canada Lumberman, Toronto. 11-12

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,

c Montreal, Que.

For Sale

2 cars 3 x 4 to 7-in. Sound Maple Hearts.
2 cars 4¼ x 5½ Sound Boxed Maple Hearts
1 car 2½ in. Soft Elm, No. 1 C. & B.
1 car 2-in. Birch, No. 2 C. & B.
4 cars 1½-in. Beech, No. 2 C. & B.
5 cars 1½ in. Maple, No. 2 C. & B.

Dry stock. Immediate shipment.

Pedwell Hardwood Lumber Co.,

9-t.f. 6 St. Ann's Road, Toronto, Ont.

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

7-t.f. Mail Building, Toronto, Ont.

For Sale

Twenty-three ton Manhattan Yard Locomotive, ten cars and rails. Apply to

E. R. C. CLARKSON & SONS,

11 15 Wellington Street West, Toronto, Ont.

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Saw filer, band or circular, wants position. 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 9-12

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Lumber Traveller for Ontario. Would prefer young man with experience. Reply confidential. Box 5, Canada Lumberman, Toronto. 8-11

WANTED—Salesman calling on the lumber trade and contractors in the Eastern Provinces, to handle Dr. J. M. Stewart's Veterinary Remedies as side line.

Palmer Medical Company, Ltd.,

10-t.f. Windsor, Ont.

Business Chances

Wanted

A thoroughly practical man with some capital to invest, capable of taking entire charge of sawmill and logging operations with a well established and successful firm owning limits containing 12 years' cut. Have a cut of three million this year. An exceptional opportunity for the right man. Owners wish to retire from active part of this end of the business. Write Box 18, Canada Lumberman and Woodworker, Toronto, Ont. 10-11

Business Opportunity

For Sale—Woodworking shop fitted especially for general work. New and up-to-date machinery. First class dry kiln. Blower system. Railway siding. Situated in a live and thriving Ontario town. Splendid local and shipping trade. This is an exceptional opportunity to acquire a good business with a trade already established.

Write J. A. C., Canada Lumberman, Toronto. 10-12

For Sale

Complete sawmill outfit. Machinery practically new. Capacity 20 M. Two boilers 60 and 40 h.p., with cold blast grates, endless log chain, 8-in. steam feed; 3 block carriage with boss dogs; friction canter and sweep; 3 saw edger; 2 saw trimmers and a full complement of saws and belting. Also Long Mfg. Co. lath mill in first class condition will be sold with sawmill or separately. Mill near White Hall, Ont. Apply to Box 41, Jordan Harbor, Ont. 11-14

British Columbia Saw Mill and Timber Limit For Sale

A 25-thousand feet capacity Saw Mill, and 90 million feet first class Spruce, Red Cedar, Hemlock and Yellow Cedar, etc., under B. C. Special License. At good shipping point near Prince Rupert, B.C. Inspection invited. A. Cuthbert, P. O. Box 456, Prince Rupert, B.C. 6-11

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. t.f

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-t.f.

For Sale

The best timber berth in Alberta, containing approximately one hundred million feet, four-fifths of which is splendid spruce. A railroad will pass within one mile of the limit this summer. The situation makes it an exceedingly easy limit to operate. Price \$2.00 per M., easy terms. On account of its close proximity to the prairie markets and easy logging, this is cheaper than B. C. timber for nothing. For further information apply to Box 25, Canada Lumberman, Toronto. 11-14

Timber Sale

Tenders will be received by the undersigned up to noon of the 6th day of July, 1914, for the right to cut the Red and White Pine timber on Berths 1 B, 1 C, and 1 D, in the Mississauga Forest Reserve tributary to the north shore of Lake Huron, each Berth containing an area of 36 square miles, more or less. For maps and conditions of sale apply to the undersigned or the Crown Timber Agents at Thessalon, Sault Ste. Marie, Webbwood and Sudbury.

W. H. HEARST,

Minister of Lands, Forests and Mines. Toronto, April 18th, 1914.

N.B.—No unauthorized publication of this notice will be paid for. 9-13

Tenders for Wood Limit

Tenders will be received by the undersigned up to and including Monday, the 8th day of June, 1914, for the right to cut wood of various descriptions on a certain area tributary to the Fredericshouse and Abitibi Rivers in the District of Temiskaming.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the ordinary Crown dues, including 40c per cord for spruce and 20c per cord for other pulpwoods, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council for the right to operate wood products mills on or near the area referred to.

Such tenderers shall be required to erect a mill or mills on or near the territory, and to manufacture the wood into products thereof in the Province of Ontario.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for ten per cent. of the amount of their tender, to be forfeited in the event of their not entering into an agreement to carry out the conditions, etc.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines. Toronto, Ont., April 24th, 1914. 10-11

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

**Timber Sale**

Tenders will be received by the undersigned up to noon of the 15th day of July, 1914, for the right to cut the Red and White Pine timber on berths 1, 2 and 3, Township of Blyth, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned, or the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Toronto, May 4th, 1914.

N.B. No unauthorized publication of this notice will be paid for. 10-13

**Sale of Pine Timber on Metagami Indian Reserve**

Tenders will be received by the undersigned up to and including the 6th day of July next for the right to cut the Red, White and Jack Pine timber over eight inches in diameter on the Metagami Indian Reserve, situate on the Metagami River in the District of Sudbury. For particulars, descriptions, conditions, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Department of Lands, Forests and Mines,
Toronto, May 2nd, 1914.

No unauthorized publication of this notice will be paid for. 10-13

**Tenders for Allan Water River Wood Limit**

Tenders will be received by the undersigned up to and including Wednesday, the 15th of July next for the right to cut ties from Spruce, Balsam, Banksian or Jack Pine, Poplar and Whitewood trees seven inches and upwards in diameter two feet from the ground sufficient to supply a tie preserving plant for a period of twenty-one years from unoccupied, unsold and unlocated lands of the Crown tributary to what is known as the Allan Water River, tributary to the Grand Trunk Pacific Railway in the District of Thunder Bay.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of \$2 per thousand feet board measure for anything not manufactured into ties, and for ties at the rate of 5c each, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council.

Such tenderers shall be required to erect within the limits of the territory covered by the right to cut ties, or at some other place approved by the Lieutenant-Governor in Council a tie preserving plant.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for \$25,000, to remain on deposit as security for the carrying out of the conditions of their tender.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.
Toronto, Ont., April 27th, 1914. 10-13

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

For Sale

Modern, up-to-date Band Sawmill, new Waterous machinery, capacity 65,000 ft. per day. Apply to

15 Wellington Street West,
Toronto, Ont.

**Miscellaneous****Saw Mill Machinery For Sale**

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

"Where Have My Profits Gone?"

That is the question that some owners in almost every line of business have to ask themselves at the close of many a year's work. The answer is not always easy. Often many factors must be taken into consideration before the true answer is found.

The extra cost caused by lack of system and up-to-date manufacturing methods is enough in many instances to entirely wipe out profits and that is exactly what has resulted in many cases. Some years turn out a profit even under the heavy handicap of poor equipment and no system, but those years are exceptional.

If it is true that the small mills of the country are becoming smaller and the big mills bigger, it is undoubtedly due, in large proportion, to the fact that the big mills in general have the most improved equipment while the small mill gets along as best it can with the equipment installed ten or more years ago. Many of those small mills that are running old equipment are—dying a slow death.

The main argument given by small mills that have not changed their ways to correspond with changed conditions is that their old equipment will take care of all the business they are getting.

That is very true but it is also true that such concerns are not getting nearly as much business as they could and would if they were equipped to go after business on a competitive basis, both as regards quality and price.

The Piling of Timber

After nature has done her part in growing good timber, and the sawyer has attended properly to his duties and has cut timber of

even thickness and with few defects, there yet remains an important work which cannot be slighted without doing damage which may offset the efforts of both the sawyer and nature. The timber should be well piled when it is put on the sticks to season. That is a step which must be attended to with care. It is as important as the sawing. The foundation should be firm and true to start with. If it is lopsided, sunken in one part, or raised too high in another, the timber will bend to fit the foundation, and will dry that way. After it has once set in that form it cannot be straightened, and its value is lessened. Sometimes a foundation is true at first, but when the load is placed on it one part, being on softer ground, sinks and the whole pile is distorted. No matter how carefully the piling is otherwise done, the timber will not dry true if the foundation is uneven.

**Mr. Roofing Dealer
—Read what Johns-
Manville Roofing
Service Does for
YOU.**

It gives you the exclusive sale in your town of J-M Asbestos Roofing and J-M Regal Roofing. That means NO COMPETITION, for the reason that they stand in a class by themselves and you don't have to sacrifice profits by cutting prices.

J-M Asbestos Roofing, made of alternate layers of pure Asbestos and genuine Trinidad Lake Asphalt, is the standard acid-proof, no-paint, no-repair roofing that gives perfect fire protection.

J-M Regal Roofing is the highest type of rubber roofing; not to be confused with low-grade, short-service roofings.

These roofings are widely advertised, favorably known everywhere, and in steady demand.

Another thing, you don't need to carry much stock. Our Branch house near you does that. Whenever you run low, just order from them and they'll ship immediately.

**Now Read what
Johns-Manville
Service Does for
YOUR
CUSTOMERS**

Johns-Manville Service gives your customers the world's standard roofings manufactured by a five-million-dollar concern, with more than fifty years' experience in the study and solution of roofing problems. It also gives them the benefit of helpful suggestions and a cheerful willingness to make right anything that goes wrong.

**Break Away from Cut-
Throat Competition and

Review of Current Trade Conditions

Ontario

It is still impossible to report any important change in the lumber trade situation in Ontario. Manufacturers and wholesalers are finding trade very quiet. Retailers in a number of quarters however, report a very fair volume of business, and they account for the quietness in the wholesale trade by the fact that many of the retail yards are carrying well assorted stocks and are purchasing only for immediate requirements, in order to keep stocks assorted. Shingles are quiet, but there is a good demand for lath, of which stocks are light. Reports from manufacturing points continue to be more reassuring in regard to the drives and the indications now point to most of the logs coming out, and a fairly normal cut resulting. Much anxiety has been felt on account of bush fires during the past fortnight, but it is reported that the rains of the last week relieved this situation largely.

In Toronto, retailers report trade considerably improved. Many retailers have all the trade they can handle and some are crowded to their capacity with orders. Some complaint is heard of price cutting, but the opinion is fairly general that there is no necessity whatever for such a course.

No alteration in prices or trade conditions is reported from Ottawa. Trade is fair, but not nearly so good as lumbermen would like. A good demand continues for the low grades, but the export business is dull. Some indications are noticed however, which point to improvement in the trade with Great Britain.

Eastern Canada

A slight reduction in the volume of business is reported from Montreal and some of the wholesalers are inclined to think that trade will make a poor showing this year as compared with last. Others however, are not of the same opinion and are looking for a revival of moderate business activity in the near future. Stocks of lumber in retailers' hands are low. Low grade southern pine continues to enter the Montreal market extensively at very low prices. In the dimension timber trade, competition is keen and the volume of business is less extensive than it was recently. Restricted driving operations and the results of forest fires are expected to reduce the amount of this year's production to some extent. Export business in pine is very slow, but a fair amount of birch is going forward.

No change in market conditions is reported from St. John. There is a fair local demand, but no increased business is expected at present. Many plans for house building have been withdrawn on account of scarcity of money, and there are no large contracts in view. Portable mills are offering lower prices for local trade than those which have been prevailing. Reports from most of the important drives indicate that they are being got out satisfactorily. The trade with the United States is very dull. It is, if anything, even quieter than it was a month ago. The English market also continues quiet, although there are signs of improvement. There is only a fair demand for shingles.

Eastern spruce manufacturers have not yet found a good market in the New England States. Some improvement is noticed but the trade in general is below normal. Reports from New York, state that stocks of spruce in the yards are fairly well assorted and that there is some improvement in the yard enquiries. At Boston there is a better demand for eastern spruce, production, however, has increased considerably. The base price remains at \$25. Occasional sales are reported at \$24.50, as a result of sharing the commission. There is a good trade in random. Frames are moving freely at a good profit. Prices are about as follows:—2 x 3, \$21 to \$21.50; 2 x 4, \$22.50; 2 x 5, 2 x 6 and 2 x 7, \$20.50 to \$21; 2 x 8, \$23; 2 x 10, and 2 x 12, \$24 to \$25. Spruce covering boards have brought as high as \$22.50. Lath are firm at Boston, some dealers refusing to take less than \$4.25 for 1½-in. The demand is taking care of nearly everything that offers. Good 1½-in. lath are selling easily at \$3.90, while \$3.80 is obtained for ordinary 1½-in. lath. Continued improvement is reported in the demand for shingles, the best extras bringing \$3.65. Clears are selling at \$3 to \$3.20 and 2nd clears at \$2.75 to \$2.90. The best red cedars are bringing \$3.75.

Great Britain

The timber trade at London continues quiet. Most of the large consuming factors are fairly active, with the exception of the contract building demand, which is still demoralized by labor disputes. Values continue steady. Stocks of last year's goods which are in steady demand are growing very scarce and there is an active de-

mand for scantling, sizes and floorings, particularly for the smaller class of houses. Freights are still easy for immediate shipment, but for later dates, owners are asking advances. At Foy Morgan & Company's recent auction sale 2nd Quebec spruce 3 x 9, 12 ft., was sold at £12 and £11 5s. Fourths brought £10 15s with £10 5s for 10 ft. and 11 ft. lengths. First Quebec, 3 x 7, 9 to 14 ft., brought £14. Seconds brought £10 and £9 15s. First Quebec pine, 3 x 11, 11 to 13 ft., sold for £29. Dry 2nd Quebec pine 3 x 10, 10 to 16 ft., brought £19 15s. Prime Quebec birch, 3 x 6/11-in., 6 to 16 ft., sold at 1s 6d per cubic foot.

At Liverpool, stocks of nearly all the leading lines are heavier than they were a year ago, and are quite sufficient for the volume of trade. The consumption shows a decrease, with one or two exceptions. The Timber Trades Journal in its issue of May 9th, referring to the opening of the spruce season says:—"Business is not quite as brisk as is usual at this time of the year. There appears to be a fair amount offering, but with the uncertainty about the freight market, buyers are not too eager to contract far ahead. Their experience up to the present time has not been over-encouraging, and the prospects of any advance in freights are too remote to make them particularly anxious to come in at to-day's figures, which, on the face of things, can be said to be reasonable enough. Apart from this there appears to be a complete lack of confidence amongst the consumers, and it is generally admitted that this year, a less number of sales have been made to arrive than has been the case for a number of years. We are now on the eve of the commencement of the season, and there are several cargoes loading, or will be on passage, and from all accounts there is a very small proportion of these sold."

Referring to the market for birch, the same journal says:—"There is not a great deal of business being done on c.i.f. terms for either logs or planks, and for what little is being transacted values are maintained—that is, of course, f.o.b. values; for naturally c.i.f. values are slightly down on account of the decline in freights. Spot values are in sympathy with c.i.f. values, and as there is a fairly steady demand all round, and the consumption at present is in excess of the import, stocks have become gradually reduced. Offers to arrive are being made with a little more freedom lately, but for these, figures are fairly well maintained, especially for the higher grades."

United States

Irregular conditions continue in the United States lumber trade, and in fact in practically all kinds of trade. The chief complaint is lack of demand. Apparently the supply of money is plentiful, but there is a general lack of confidence when a question of investing money in new enterprises or extension of old ones, is brought up. Uneasiness continues in regard to the attitude of the government at Washington, business men still fearing that the government has not yet finished its interference with big business interests. It is felt also, that so soon as the government shows a disposition to change its policy in this regard, an important improvement will develop. Fundamental business conditions are generally considered to be quite sound. Latest government estimates of the winter wheat crops are the best on record. Agricultural conditions were never better than at present. The big industries, however, are marking time and speculation is at a low ebb.

In the lumber trade everyone admits his inability to see very far into the future. Buying has been restricted entirely to current requirements. Speculative buying has disappeared. Stocks in dealers' yards and in consumers' piles are low, and any increase in demand would immediately stimulate trade, resulting probably in quite a rush for stocks. Railroads are still out of the market, but there is a fair amount of activity in connection with the building trade. Southern pine conditions show no change. The northern pine trade is quiet, but prices are steady. The demand in the larger towns and cities shows expansion, but the country yards seem to be doing very little business.

Northern hemlock manufacturers report an increase in the number of orders. Prices are still below those of last year, but mill men look for improvements in the near future. The hardwood market is lacking in vigor, but prices are holding very satisfactorily. Consumers are doing very little buying and are using up any reserve stock they possess. The demand from the implement and vehicle trade is fairly good. Export hardwood business is increasing slowly.

At Manchester, the timber trade is very much of a "hand-to-mouth" character and prices are low. Monthly stock sheets, however, are showing a little better state of affairs. Spruce deals are in

poor demand. Prices of yarded stock have been lowered in order to find buyers. With 3 x 7 in. as a basis, the present value is £10 to £10 5s ex stocks. The stock amounts to nearly 10,000 standards, which is very heavy for this time of year.

At Glasgow, there has been some improvement of late in the demand for Canadian white pine goods. Fairly good sales are reported, of late, in waney boardwood, first pine deals and sidings and also in the lower grades. Stocks in general are moderate, with the

exception of first quality waney logs. Spruce deals are moving slowly, but stocks remaining on hand are light.

Direct shipments of paper and pulp from Newfoundland to Manchester are increasing year by year. In 1913 the growth of the industry broke all records and it is anticipated that by June, 1914, the total export will be of the value of £850,000. The total which reached the United Kingdom in the last fiscal year was paper valued at £400,000 and pulp at £70,000.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

St. John Trade Quiet—Drives Coming Out Well

St. John, N.B., May 19th (Special to the Canada Lumberman): The market conditions at St. John remain unchanged, since the last writing. The demand for lumber locally is only fair, and no increase of business is looked for at this time. The house building trade is moving along slowly. While a fair amount of building is going on, many plans have been withdrawn on account of the people being unable to find the money to carry on the work. There are no large contracts in view at the present time, the largest being about a \$50,000 contract to build a sanatorium near Courtenay Bay. Prices in many cases for local work are being shaded; and it looks as if they will go lower instead of higher. Many bargains are now being offered by the portable mills, which are shipping their winters cuts of lumber to market. There are large quantities of these stocks, and as the portables make a large amount of refuse, or second quality stock and are not finding a ready market, they are forced to sell cheaply.

During the past two weeks the water has risen higher than for twenty-seven years, and some of the mills were forced to remain idle for a few days, but the water is now receding fast owing to extremely dry and cold weather. If rain had fallen during the past ten days a tremendous freshet would have occurred and much damage would have been done along the river. All the drives on the St. John are coming along in good shape. Of course there are always a few logs left. On the Salmon river, Grand Lake, Messrs. King & Sayre are both out with their drives in record time. On the Tobique river, Messrs. Miller & Fraser are out, and practically all of Messrs. Stetson, Cutler & Company's logs are out with the exception of about two million which it was said they were forced to leave on the Nectau, a branch of the Tobique, caused by a dam blowing out. On the head waters of the St. John, the drives are coming well. On the Nashwaak, the Partington Pulp Company are about out, but the streams are now beginning to dry up, and unless rain comes soon some logs which are now fairly safe may be left.

Prices of bank logs at Springhill have been very high, the buyers in some cases paying \$15 per M. for logs and \$11 per M. for battens and inferior logs. This will make the logs cost from 75c to \$1.00 per M. more when delivered to St. John, which makes them practically unprofitable.

Very little business of any kind can be had from the American market, which shows no improvement. In fact if anything it is harder to sell than a month ago. Narrow random has been sold as low as \$18.50 per M. delivered New York. Laths are the only stock for which a steady demand has taken place both in New York and Philadelphia. Prices can be said to range from \$2.90 to \$3.00 per M. on wharves at St. John.

The English market also remains quiet, although perhaps in a somewhat stronger position than a month ago. A seller who had deals to offer at present would find it hard to dispose of them at a price that would leave any profit on the cost of material. Dry pine seems to be the only kind of lumber in demand on the market at the present time and very little of this stock can be had here. Prices are firm.

Shingles are only in fair demand, both for shipment and locally. The British Columbia shingle is to-day being sold in St. John as cheap as the local manufactured article.

The trade in box shooks is quiet and orders are coming in slowly.

Bush Fires Make Ottawa Firms Anxious

Ottawa, May 23rd (Special to the Canada Lumberman): About the most serious matter that has concerned the lumberman in the Ottawa Valley and Gatineau districts during the past week has been the bush fires that have been raging. Though no very serious damage has been done to the limits containing merchantable timber, this has been due to the efforts of large gangs of fire fighters. On Thursday of this week reports came from Maniwaki, Que., that the village and

valuable timber limits nearby were in danger of being wiped out. At the time of writing, rain is falling heavily in the Algonquin Park district and north of North Bay and is coming towards Ottawa. The fact that the wind kept down all week prevented serious results from the bush fires. One of the most disastrous fires of the week was at Portage du Fort, Que., a lumber village on the Ottawa, 50 miles above the Capital. The whole of the business section was completely destroyed, entailing a loss of \$140,000, against which there was \$51,000 only of insurance.

Owing to the prolonged period of dry weather the water is exceptionally low in the Ottawa and other rivers and streams in this section of the country. If rain does not come soon in substantial quantities, operations in the saw mills will be seriously handicapped and consequently this year's cut will be affected. In the small streams the logs are piling up through the scarcity of water. It is several years since the water in the Ottawa was as low at this time of the year as it is just now, but this is partly because the conservation dam at Lake Kippewa has not yet been opened this season. The dam was put into operation for the first time last summer. The reserves in Lakes Kippewa and Temiskaming are rapidly filling up and as soon as water is required in the lower Ottawa the dams will be opened.

Local trade is fair, but not so good as the lumbermen would like. There has been no alteration in prices for several weeks nor is there likely to be for some time to come. The demand for low grades, such as spruce and mill culls continues fair. Export business is dull, but there are signs that it will improve for some English buyers have been making inquiries recently. The commercial world, of which the lumber industry is an important unit, has not yet recovered from the financial depression of last year.

Conflicting Views Upon Montreal Trade

Montreal, May 23rd (Special to the Canada Lumberman): Business is only moderate, and has eased off a little lately. Some of the wholesalers take a decidedly pessimistic view of future trade, and look for a falling off in the turnover as compared with last year. They base their opinions on general commercial conditions, and, so far as the local situation is concerned, on a reduction in the building programme. As showing the character of the great majority of the buildings going up, recently, permits were taken out in one day for \$240,000 for residences. These gloomy views of conditions are not shared by other wholesalers, who are satisfied that there will be a revival, although they do not expect anything in the shape of a boom. Stocks in retailers' hands are stated to be low, and this is undoubtedly a favorable factor.

A large amount of poor grade American pine is still coming into the market and is selling at comparatively low prices.

There is keen competition in the dimension timber trade, and although some good orders have lately been placed here, business has slackened materially.

The dry weather has restricted driving operations in the province of Quebec, and a considerable quantity of logs which could not be floated down, owing to the low water conditions, has been burned in the forest fires which have prevailed. These two factors will mean an appreciable diminution in the cut.

The export business is still very slow. A fair amount of birch timber is going forward, but very little pine.

Ground wood prices in the United States have declined—and are now down to the lowest point for a year. This has naturally had an effect on Canadian quotations. Contrary to expectations, the water conditions over the border are very satisfactory, and consequently, few orders are coming to Canada.

There are fair stocks of chemical pulp on hand, and trade is quiet. The Secretary of the Scandinavian Pulp Association has been on a visit to United States and Canadian mills.

London Market Looking More Settled

Churchill & Sim, London, England, in their quarterly wood circular, under date of May 4th, say: The deliveries for the first four months of the year are about 1,300 standards in excess of the total quantity delivered up to the end of April, 1913, the progressive nature of the improvement having been checked by the Easter holidays, and owing to the fact that in spite of much negotiation, no settlement has been arrived at between the master builders and their workmen in the London district. The general importation for the month has been smaller than usual, and the available stock is now in more moderate compass, battens, and scantlings especially, having been much wanted. In spite of some pessimistic forecasts, the market ahead looks more settled than for some time past. The buying has been less wholesale and consequently less speculative. Importers have been moving more cautiously than usual throughout the season, but as the large stocks in the country at the end of last year are becoming gradually absorbed, stocknotes are being depleted without reduction in values. Freights have proved no hindrance to business, but there has been no further decline in rates during the month.

The stock of timber, deals, etc., at the public docks on the first of May included the following:—

	1914.	1913.	1912.	1911.
Colonial pine deals and battens in pieces	485,000	367,000	324,000	409,000
Red pine	19,000	20,000	43,000	55,000
Spruce ditto	689,000	427,000	429,000	470,000
Oak timber				34
Oak planks, etc. (American)	3,890	1,493	2,207	1,396
Birch timber	257	179	190	165
Birch planks	4,524	3,738	3,373	2,060
Elm timber	1,794	247	328	721
Ash	40			
Yellow pine timber	896	758	254	131

No importations were reported from the St. Lawrence. From New Brunswick, importations were as follows:—

Pine deals	3,000 pieces	against	Nil pieces in 1913
Spruce deals	74,000 pieces	against	141,000 pieces in 1913
Birch planks	156,000 pieces	against	149,000 pieces in 1913

Large parcels of birch planks have arrived, but prices are well maintained. A few spruce deals came to hand during April, and although the stock in London is ample, prices are inclined to harden, and there is some competition to acquire good parcels at the current rates. There was no movement in pine deals, the deliveries being very small, and prices are unaltered except for very prime lots, which are unaffected by the general quotations, and command very high values which must tend towards the seeking after substitutes.

British Columbian and Oregon pine.—The lower prices have attracted some demand, but the stock is still too large and has been increased by the arrival of a sailing cargo. This timber, mostly of long lengths which cannot be produced from the pitch pine ports, is gradually forcing its way to the front, and its present cheapness is tending towards its more general use by contractors.

Liverpool Trade Still Quiet

In their monthly wood circular, under date of May 1st, Messrs. Farnworth & Jardine, Liverpool, Eng., report as follows:

The business of the past month was again of a quiet character. The arrivals all round were fairly moderate, but with inactive demand the deliveries were disappointing, being in the aggregate some 12½ per cent. less than corresponding month a year ago. Stocks of several leading articles are still too heavy, but values generally have been fairly maintained. For ocean deal freights, chartering has been dull.

Canadian woods. Pine timber.—The market shows no change. Waney pine, 1st Class.—No arrivals; the consumption has been very limited; the demand is dull but stocks are reasonable and prices firm. 2nd Class is little enquired for and stocks are sufficient. Red pine.—No movement to report. Oak.—There has been a slight reduction in Manchester stocks. Some railway orders have been placed during the past month but otherwise the demand is restricted; stocks are light but prices are rather easier. Elm.—There has been no import of square wood; values are steady and stocks are not excessive; a few parcels of round wood have arrived via Portland, Me. Pine deals.—A small import to Manchester; the demand is not brisk and consumption has been disappointing; stocks are rather heavy; values unchanged. Red pine deals.—No change.

New Brunswick and Nova Scotia spruce and pine deals.—The import during April to the Mersey (including Manchester), amounted to 2,530 stds., against 3,790 stds. the corresponding month last year, 76 per cent. being to Liverpool. The consumption has been only fair, and stocks are still too heavy; liner shipments from Halifax, N.S. and St. John, N.B., have been sold at low rates. For the better class stocks, in cargo shipments, prices remain fairly steady, but sales are difficult. Pine deals are in fair demand.

Birch.—Logs.—There has been an import of 32,000 cubic feet, chiefly from St. John, N.B. The consumption has barely kept pace, but stocks are moderate. Values firm. Planks.—The import has been light while the deliveries have been fair, and stocks are now reduced to a fairly low level. Prices are firm.

United States oak logs.—There has been no import during the past month, stocks are ample for the quiet demand; prices are easier. Planks have come forward freely, stocks are heavy, and prices difficult to maintain; shippers should act cautiously in consigning; the total stock including outside depots now amounts to 431,000 cubic feet, as compared with 395,000 cubic feet this time last year.

British Columbian and Oregon pine.—No arrivals. Deliveries have been moderate; stocks are still heavy and prices difficult to maintain.

Current prices are quoted as follows:

YELLOW PINE TIMBER—	£	s.	d.	at	£	s.	d.
Quebec, square wood, per cu. ft.	0	2	9		0	4	0
Waney board, square wood, per cu. ft.	0	3	0		0	5	6

Barbados Market

S. P. Musson, Son & Company, Barbados, report under date of May 8th, as follows: Lumberstuffs.—White pine.—There have been no arrivals during the fortnight, but dealers will not make any contracts as they have plenty of stocks. Spruce.—No receipts, but supplies are sufficient for present requirements. Pitch pine.—The "S.S. Mecklenburgh" brought 105 m. ft. which had been previously contracted for. Shingles.—The S.S. "Chaleur" brought 50 m. clear whites which were imported for a dealer. No receipts of extra No. 1 or Long Gaspé, but some of the former have been sold to arrive. Shooks.—No arrivals. Wood hoops.—Receipts consist of 600 bdls. by the S. S. "Spheroid" and 500 by the "Serrana," both lots having been imported on dealers' account.

Profit from Low Value Lumber

THE LINDERMAN AUTOMATIC DOVETAIL GLUE JOINTER will enable you to solve three important problems. YIELDING \$4.00 to \$6.00 MORE PROFIT PER THOUSAND.

1st. 4-in. COMMON LUMBER.

In most Western Mills this is sold for approximately \$7.50 per thousand, whereas 8-in. shiplap brings from \$14.00 to \$16.00.

THE LINDERMAN DOVETAILER will take two 4-in. strips, convert them into a board $7\frac{3}{4}$ in. wide, allowing $\frac{1}{2}$ -in. for jointing both edges to make the lap, leaving a full 7-in. face, at a cost of .75c per thousand board feet. Add the cost of handling the lumber and of milling it into shiplap, leaves a net profit of at least \$4.00 a thousand.

2nd. No. 3 GRADES, 6-in., 8-in. and 10-in. wide.

In most Western Mills No. 3 Grades increase in price perceptibly as it increases in width. One prominent lumber manufacturer maintains by converting 6-in., 8-in. and 10-in. widths of this grade into 12-in., 14-in. and 16-in. lumber, he will be able to obtain fully \$4.00 a thousand more for it.

The cost of jointing this lumber on a LINDERMAN MACHINE is .75c per thousand, leaving a net profit of \$3.25.

3rd. 2-in. and 3-in. STRIPS.

Practically all mills leave in the slab or convert into lath all lumber, regardless of grade, under 4-in. in width. By installing a LINDERMAN MACHINE and by saving all 2-in., $2\frac{1}{2}$ -in., 3-in. and $3\frac{1}{2}$ -in. stock this lumber can be converted into any width board desired at a cost which will average approximately \$1.00 per thousand board feet. Profit from \$4.00 to \$8.00.

We are willing to send, at our expense, several pieces of 16-ft. long 8-in. lumber joined by our method, in Spruce, to any Lumber Manufacturer in the Dominion to be milled by his usual method, inspected and put to any test as to strength, durability and equality as compared with 8-in. one-piece stock, or we will join up any lumber which we can purchase in our local markets if spruce is not acceptable, or will join free of charge and will stand transportation charges both ways, any lumber which may be sent to us up to 1,000 feet.

A LINDERMAN DOVETAILER installed in your mill should and can save you at least \$5,000.00 a year, if not more. We realize thoroughly this is a large figure, but would like the opportunity of putting our proposition before you so that it may be thoroughly considered by you and your assistants.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

Fireproofing by Cement-Gun Process

The Gun-crete Company has opened its new offices in the McCormick Building, Chicago. This firm specializes in Cement-Gun work for engineering, industrial and mining structures. It has at its disposal a large amount of the most modern Cement-Gun equipment, and a very efficient working organization.

The Gun-crete process they state, will prove especially valuable to lumbering and woodworking plants for the fireproofing of the machinery buildings, dry kilns, etc. The process consists of covering the interior or exterior of the building, or both, with wire fabric, and then applying a cement-coating with compressed air.

This process has been extensively used and is claimed to be considerably cheaper than any other known method of fireproofing. Gun-crete is also advantageously used for encasing steel structures, bridges, tanks, docks, wharfs, etc.

Mr. Carl Weber, the president of the Gun-crete Company, is widely known as a successful cement-engineer. He is the inventor of the reinforced concrete Chimney of which thousands have been built and has designed and erected a large number of other important engineering structures. He has been connected with Cement-Gun operations for some time and is a leading expert in this kind of work.

Corrugated Joint Fasteners

Corrugated Joint Fasteners are ever increasing in usefulness. They are handy for any kind of wood joining and most convenient for uniting two piece basket bottoms, picture frames, screens, and for repairing furniture, etc.

Corrugated Fasteners are made in two styles, plain edge and saw edge. Plain edge fasteners are generally used for hardwoods, or for driving into the end grain of soft woods, such as joining narrow

Corrugated joint fasteners—a useful device.

widths for box shooks. Multiple point or saw edge fasteners are better suited for soft wood when driven across the grain as they cut their way more readily than the plain edge without crushing the wood. They are packed in boxes containing 250 fasteners or in kegs of 100 lbs. each.

Corrugated Joint Fasteners are manufactured by the Steel Company of Canada, Limited, Hamilton, Ont., who will send samples and quote prices willingly on request.

Forced Draft and Economizers

Among lumber manufacturers and pulp and paper manufacturers in Canada a very general belief prevails in regard to the benefit secured by the use of fuel economizers and forced draft. Interesting instances of the recognition of this benefit are afforded by the cases of the Brompton Pulp and Paper Company, East Angus, P.Q., who are installing a 1,200 B.h.p. economizer; The Belgo-Canadian Pulp & Paper Company, Shawinigan Falls, P.Q., a 750 B.h.p. economizer; also the Toronto Housing Company, a 450 B.h.p. economizer and the Canadian Kodak Company, Toronto, a 1,200 B.h.p. economizer. These installations are being made by the B. F. Sturtevant Company of Canada, Limited, Galt, Ont.

Recently, at a meeting of the Chicago section of the American

Society of Mechanical Engineers, Mr. W. L. Abbott of the Chicago Commonwealth Edison Company, during a discussion of "large steam power plants," spoke very strongly in favor of economizers and of mechanical draft. The Chicago Commonwealth Edison Company operates one of the largest central stations in the world and Mr. Abbott's views are very well worth noting, especially as he is one of their most prominent engineers. In regard to boiler operation Mr. Abbott said:

"Air is taken at a normal temperature, heated up to 2,000 or 2,500 deg. and cooled down to 500 or 600 deg. The rest of the heat is used to create a draft, that is, the air is driven up a smokestack, pulling fresh air after it, through a fuel bed. To use twenty per cent. of the heat of the fuel merely to push air through the fuel bed is a wasteful process. It is true that the temperature of the water in the boiler is some 400 deg. and cannot cool down the air. The remedy is to use economizer and cool down the furnace gases, to the lowest point possible. Abolish smokestacks for the purpose of creating draft. Boilers are being forced 100 per cent. every day, and with forced draft from 300 to 400 per cent. and still the limit has not been reached. The boiler can be cut in two, and half of it forced in 500 per cent. if necessary. The other half could be used as an economizer in two stages if need be, and the gases cooled to the temperature of the feed water. In this way, there is a possible saving of 20 per cent."

Definite statements of this nature in favor of economizers and forced draft are becoming more and more frequent, due undoubtedly to the fact that economizers have accomplished remarkable fuel saving.

Sawmill Resaws—What They Must Do

An interesting and attractive booklet upon band resaws for sawmills has been published by Wm. B. Mershon & Company, Saginaw, Mich. The book contains a number of interesting illustrations of the various vertical and horizontal resaws for use in sawmills, manufactured by this company. Good descriptions of these saws and the work which they will do are contained in the book.

Referring to the work which a resaw for sawmill service is required to do, the book states that the fundamental requirements of a vertical resaw in a sawmill are as follows:—

"It must self-center; that is, divide up the surplus thickness of plank which are plump, making the lumber of uniform thickness in the piles.

"It must not self-center plank which are so scant in thickness that they will not yield two perfect boards—but it must automatically make one good board, instead of two saw culls.

"It must reclaim one or more merchantable boards from every slab which for any reason has left the carriage thicker than it should.

"In sawing small logs the resaw should be capable of converting the entire log into lumber after it has been split by the band mill.

"It must have set works by means of which the sawyer can instantly, conveniently and accurately set the feed rolls, so as to resaw anything that goes down the live rolls, regardless of its dimensions, into any desired finished thickness—it must saw anything in any way desired.

"Finally, the sawmill resaw must be simple in construction, easily understood and operated, and not likely to get out of repair or adjustment."

Mershon sawmill resaws, it is claimed, meet all of these requirements fully.

In addition to the descriptions of the resaw, the book contains two very interesting floor plans of sawmills showing the position which the resaw should occupy.

The National Lumber Manufacturers' Association recently decided to hold their 1915 convention at the Panama-Pacific International Exposition in San Francisco. In addition to the convention, there will be an exhibit of lumber and manufactured products consisting largely of the travelling Forest Products Exposition, which after being displayed in various eastern cities will be housed in one of the exposition buildings. The Concatenated Order of Hoo-Hoo will also have a varied exhibit of lumber products in a unique lumbermen's building which it will erect at the exposition, at a cost of \$50,000. This building will also be used as a social headquarters for lumbermen in general.

Ball Bearings in Woodworking Plants

The Importance of Eliminating Friction—Increased Load Available Without Installing Additional Power—A Subject Worthy of Close Study

By N. G. Near*

Many a man thinks conditions in his shop are all right "just as they are" so long as the wheels go 'round and external appearances are kept up. Running under such conditions, it is an undisputed fact that the ledgers show a neat profit in many factories at the end of each fiscal year, and that is the principal reason why the owners are wont to overlook the possibility of increased earnings. As one writer very aptly put it, "The dollar the man is making blinds him to what he is losing." I myself suggested some changes to the owner of a large plant not so long ago, and, although he listened in an interested way his reply was, "It's a lot of trouble putting in a pile of new apparatus just to save a few cents, and it costs money to make the changes. I hope some day to have a model shop, but we are so busy right now that I can't think of improvements." Anyway, we're making a good profit. What more could I want?" Such an argument is not very easily answered. It is where the owner is discontent with his output that you get a ready audience with your money saving methods.

A Difficult Problem Solved

I have in mind a woodworking plant where there were two planers, a saw, several lathes, a sander and a grindstone, all driven by a 10 horse-power gasoline engine. When all machines were in use at the same time the engine was taxed to its limit; it would slow down and threaten to stop, and in order to bring the engine back to normal speed one of the planers would be cut out. This worried the owner considerably for it certainly was costing him the wages of one man during the time the planer was out of commission, besides, he had so much work to do that he was considering the installation of more machines. His problem was: how could he increase the capacity of his plant without buying a new engine capable of handling the entire load with new machines installed, or without buying another smaller engine large enough to run the additional machines? He wrote letters to manufacturers of gasoline engines and found them all ready to sell. Some of them sent representatives who looked the plant over, and on being asked for advice as to the correct way to proceed most of these representatives told the owner that the best way to handle the proposition was to install a new, smaller engine, which could be run during "peak" periods, the old engine being large enough to handle the usual load. The owner was told that this arrangement would be "most economical."

Proof Furnished by Experience

Some ball bearing salesman heard of the predicament of this man and decided to pay him a visit and see whether or not ball bearings would not solve the problem. The owner listened to the salesman's proposal but that was about all. He laughed at him when the salesman told him that it was quite possible to get along with the old engine with more machines on the line shaft. By this time the owner had practically decided to install a new, smaller engine, and he had given the matter so much thought that he believed no other solution was possible. However, he picked up the threads of the salesman's arguments and wrote to several ball bearing manufacturers to find out whether or not this salesman's assertions would be confirmed by competitors. He was delighted to find that all of them answered him in about the same manner: they all assured him that experience had proved their point. Much less power is required both to start and to drive a shaft mounted on ball bearings. Both scientists and practitioners have shown this to be true. And the friction does not increase with gumming, as in plain bearings, because balls need practically no lubricant. All that is necessary is enough lubricant to cover the surface and keep the balls and races from rusting. As for wear, there has been such an advance in methods of manufacture and in materials that renewals need not be made for many years, in the average installation. Of course, dirt and grit must be kept out or they would soon grind the surfaces rough, the fits would loosen, and the bearings would soon give most unsatisfactory results. But the same is true of plain bearings; it is just as absurd to allow grit and dirt to get into them. So, it is now found that there are very few places where plain bearings are used, in which ball bearings could not be used also, and, so used that they would emphatically reduce friction.

Steadier Power and More of it

The owner studied these points over carefully and soon decided to throw his new-engine-proposition overboard. He called in the salesman who had first visited him and told him to go ahead with the job and show him with actual figures just what savings would result

from his scheme; figure on the size of bearings needed, and render such service as was unavailable in the owner's staff. This the salesman did, and after the bearings were installed the owner's face looked much brighter. The engine was running along at a pretty clip with much less effort than on the day before with the plain bearings still in. The normal speed of the engine was 240 r.p.m., and since it was built on the four-cycle hit and miss principle there were about 120 explosions per minute on the previous day. To-day he counted only 90, with all machines running simultaneously! This meant that he could still increase the capacity of his plant about 40 per cent, which certainly would be sufficiently large for many years to come. He bought additional machines as needed, installed them, and now has almost twice as many as he had before changing over to the ball type. No greater ball bearing enthusiast can be found, for the many savings this owner has discovered that are attributable to ball bearings have made him an ardent enemy of the old, plain type. He did not have to install new belting except on the new machines; his lubricating costs were cut down materially; and the cost of maintenance was emphatically reduced. Besides, he found that the quality of workmanship was bettered, not because the workmen were doing better or more careful work, but because power came to the machines much more smoothly; it seemed that vibrations had been materially reduced.

Not An Exceptional Case

The above is not an exceptional case. Nearly every plant in the country is being increased in capacity from year to year, and, to drive more machines, more power, of course, is needed. It is obvious, then, that where conditions are similar to those in the above example it is well worth while to install ball bearings or to at least give them a thought. They might not solve all problems, for much depends on the number of bearings in service and the alignment of the shafting. It is often possible to get around the installation of ball bearings for a season by cleaning the old bearings, rebabbiting them, and lining the shafting properly.

Manufacturers now-a-days are uniformly truthful in their statements. If they tell you a certain thing is possible you are pretty safe in giving them consideration. Engineers and skilled mechanics are employed both in the field and in the office to give free advice to prospective and old customers and they are explicitly informed by the manufacturer always to be frank and honest in all of their dealings. They know from experience that it pays to be truthful in making claims for their wares and it is their business to make the transaction an economical and satisfactory one for the purchaser, as well as a profitable one for the manufacturer. Further, should failure occur in a ball bearings, the manufacturer is usually willing to fix things up at reasonable cost provided the bearing was at fault. Of course, if a man spoils a bearing through sheer blunder, the manufacturer can hardly be expected to hold himself responsible. If the bearing is entirely at fault the manufacturer will usually fix things up at his own expense for no live concern can afford to harbor failures. Black eyes are bad in business.

Personal Paragraphs

Mr. James Reid Wilson, Montreal, whose death in London, Eng., was recently announced, was a director of the Wayagamack Pulp and Paper Company, Limited.

Mr. L. M. Wood, Toronto, has been elected president of the Standard Chemical Iron and Lumber Company, Limited, to succeed Lt.-Col. A. G. Peuchen, the former president who has retired in order to devote more time to his personal interests.

Mr. C. W. Wilkinson, vice-president of the Union Lumber Company, Limited, Toronto, returned last week from an extended trip to Europe. During his absence Mr. Wilkinson visited many points of interest in England, France, Germany, Italy and other well known centres.

C. C. Muir, formerly secretary of the New Ladysmith Lumber Company, Nanaimo, B.C., has assumed the duties of manager of the Island Lumber Company, Duncan, on the Esquimalt & Nanaimo Railway, between Victoria and Nanaimo. This mill has a capacity of 100,000 feet per day.

The Canada Lumber Sales Company, Montreal, were represented at the New York Forest Products Exhibition by Messrs. Arthur P. Beaupre, managing director, and J. Henry Poulin, sales manager. One of the objects of the visit was to meet principals of the United States mills with whom the company do business.

Canadian Timber Trade in the Far East

Reports from Commissioners Explain Recent Decreases and the Increase in U. S. Trade in the Same Markets

The Department of Trade & Commerce, at the request chiefly of the Forest Branch of the Department of Lands of British Columbia, recently sent out requests to Canadian Trade Commissioners for reports upon the markets for Canadian timber and lumber in various foreign countries. In the weekly report of the Department for May 11th several replies to this request are published. The Canadian Trade Commissioner for Japan reports in part as follows:—

The imports of lumber are considerable and are increasing. In 1910 Oregon pine, fir and cedar to the value of 749,940 yen (\$374,970) were imported from the United States, Canada and other countries, which increased in 1911 to 813,741 yen (\$406,870), in 1912 to 1,029,505 yen (\$514,752), and in 1913 to 1,279,771 yen (\$639,885). Of the pine, fir and cedar imported in the years under review, the United States supplied over 87 per cent. and Canada about 10 per cent. Oregon pine (Douglas fir) is used in Japan in construction work of all kinds, in buildings, bridges and other structures, and the demand is increasing.

Among the lumber importing firms in this country, both foreign and Japanese, there is a good deal of conflicting opinion as to the reason why Canadian lumber is so little used, while United States lumber from Portland, Seattle and Tacoma comes into the country. While some attribute it partly to higher prices, and others to delay on the part of manufacturers in the execution of their orders, all seem agreed in the opinion that the difficulty of securing freight space on steamers, and then only at irregular intervals, is the real stumbling-block in the way of the development of this branch of Canadian trade. Lack of knowledge on the part of consumers in regard to Canadian lumber, and therefore lack of demand for it, also contributes.

The flooring used is tongued and grooved, 1 inch in thickness by 2 inches to 6 inches in width, ranging from 12 feet to 24 feet in length. Ship timbers are 6 inches by 8 inches, 20 to 32 feet long. Decking in demand is 2 inches by 5 inches to 4 inches by 6 inches, length 30 feet to 50 feet. Heavy timbers range from 12 inches square to 25 inches square, from 25 feet in length up.

Lumber imported into Japan for the four years 1910, 1911, 1912 and 1913 is shown in the following table:—

	Pine, Fir and Cedar

*1 Yen = 50 cents (Canadian currency.)

The duty on pine, fir and cedar (with the exception of cedar of a size 17 $\frac{1}{8}$ inches x 2 $\frac{3}{4}$ inches x 9/32 inch or less, which is free) not exceeding 2 $\frac{1}{2}$ inches in thickness, is 3.10 yen per cubic metre (= 423.77 board feet) or \$3.65 per M board measure, and on pine, fir and cedar over 2 $\frac{1}{2}$ inches thick, is 1.80 yen per cubic metre, or \$2.12 per M board measure.

Chinese Railways Need Canadian Ties

The same commissioner's report in regard to the market in China says:—

An effort has recently been made to induce the chief engineers of the various railways under English management, to specify Canadian in addition to Australian, Japanese and American wood when inviting tenders for the supply of railway sleepers (ties). In general the effort has been met in a sympathetic manner, the answer received plainly showing that Canadian ties would have a good chance in this market if quality and price are as good as from other sources. A wood largely used for this purpose in the past is Australian Jarra, an extremely hard wood, in which holes for spikes are drilled before they leave the storeyard.

Interviewing one of the largest English firms in the far east at Shanghai, who import large quantities of railway material, the manager of the lumber department stated that his firm would much prefer to import Canadian railway sleepers and lumber rather than United States, merely for reasons of sentiment.

Sleepers for India

There is a large market in India for railway sleepers. An engineer employed by the Indian Government and representing the Indian Government Railways and two private companies, travelled recently to the Pacific coast and through to the Eastern States to buy a million

sleepers. They were required to be of the best quality and creosoted to resist the encroachments of the white ant.

This engineer was making his fifth trip to America for this purpose, and was not very hopeful of getting what he required on the Pacific coast, or even in the Eastern States, without a great deal of trouble, if at all. It appears that, in addition to the wood being often cracked and split, the creosoting is usually badly done, the wood not being thoroughly impregnated with the oil, and the latter itself more often than not being of inferior quality.

Trade With Australia

The Canadian Trade Commissioner for Australia reports in part as follows:—

Taken as a whole, the importing of Douglas fir into Australia, from both the United States and Canada, has for some time been unsatisfactory business to the Australian trade. Many of the large saw millers in Australia have recently ceased importing cargoes. They have gone out of the cargo business as they have found it pays them better to buy in "parcels" or part cargoes often when actually on the voyage.

The cause of the change in the old established procedure is simply that the American shipper (i.e., the brokers in the business with representatives at Sydney and Melbourne) have found it more profitable to gamble on the freights than to make a profit on the lumber itself.

The bulk of Douglas fir comes to Australia on time chartered steamers—every day's delay counts materially either in loading, bunkering and discharging—and because United States ports provide quicker facilities for loading than British Columbia ports it makes it more profitable for the shipping or selling brokers to load cargoes at Washington State and Oregon ports.

A leading firm in Sydney (of undoubted reputation and integrity) when interviewed in relation to the comparative rates of loading steamers in British Columbia and United States ports, stated:—

"Hitherto we have not been successful in exceeding an average of 200 M feet board measurement per working day on the British Columbia side, whereas Puget Sound and Columbia River frequently load steamers up to 400 M feet per working day. We may add that our last cargo from Puget Sound averaged 300 M feet per working day, although handicapped by having to follow another large steamer at the same mills."

It is obvious, if quotations for the timber are similar at British Columbia and United States ports—and other expenses are on a parity—that if a steamer, engaged on a time charter, can load at least 50 per cent. quicker at one port, this port will get the business. The Hastings Mill (B.C.) has recently loaded at the rate of 250 M feet per working day, which shows improved facilities.

Increasing Imports of Douglas Fir

The large and increasing imports of Douglas fir (known here as "Oregon") into Australia are chiefly from Columbia River and adjacent ports, where an inferior grade of lumber (in comparison with that from British Columbia) is furnished. It is sold at attractive prices to the Australian buyer and, naturally, he overlooks the quality because the business is profitable. From inquiries made in various reliable sources, the quality of the British Columbia lumber is ad-

BELTING

PACKING

HOSE

Increased Plant Efficiency

Goodyear Equipment sets a new standard of efficiency and service in the lumber mill—from packing for pipes to the big master transmission belts that must

“stand the load” day in and day out without stretching or breaking down.

Service being the paramount consideration, the economy takes care of itself.

Belting

Goodyear Belts are made to meet exact and unusual conditions. Only the best cotton duck, laboratory tested, is used, impregnated and covered with the highest quality of rubber for maximum service. Each belt is vulcanized under hydraulic pressure. Your Goodyear belt is *right* when you put it on—*stays* right—no after adjustments necessary—no loss through interrupted production and belt repairs.

From the Goodyear “Quality” Belting for the main drive, to the “Imperial High Speed” Belting for edger, trimmer and planer work, every exact requirement is met. Tell us your belting needs, and we will tell you just what belt—and *why*!

Goodyear Efficiency Bureau Put your factory equipment problems up to Goodyear. Costs you nothing to confer—no obligation. Tell us your needs and we'll tell you of the exact equipment. There's satisfaction, service and saving in starting right. To the cost of poor equipment you must eventually add production loss. Think that over!

THE GOODYEAR TIRE & RUBBER COMPANY OF CANADA, Limited
Head Office, Toronto, Ont. Factory, Bowmanville, Ont.

Packing

For high pressures and low, steam, water, gas, air, ammonia, oils, greases and acids, there is just the specific Goodyear Packing for the very purpose. No need to constantly dismember pipes to renew packing. No escaping steam—no lost power—no fumes—no lost motion—no lost dollars. Goodyear Packings save equipment, time and money.

Hose

Goodyear Steam Hose stands the heat without rapidly “cooking to death.” That is because of the special compound used for the lining and the Goodyear method of curing. Marlin woven. This allows of even expansion and most comfortable handling. There's a big difference between hose made to meet a price, and Goodyear hose made for service. And even on a “price” basis the *service* kind wins out.

D. C. CAMERON, President and General Manager.

mittedly superior to the bulk received from the present principal sources of supply in the United States. Some importers expressed the opinion that "it only requires a series of regular supplies from mills in British Columbia to establish a name for quality and cutting that would create a constant demand for Canadian Douglas fir." Further, "with the experience of regular shipments, Canadian lumber mills and collieries would better their facilities for loading and despatch."

In connection with the Australian trade the Commissioner suggests that the following obstacles must be overcome by British Columbia lumber shippers in order to increase their business with Australia:—

1. Better loading facilities in United States Pacific ports and the obvious saving to charterers of steamers.
2. Better facilities for loading bunker coal at a less cost than in British Columbia ports.
3. Slightly more favorable bank exchange in the United States.
4. Better opportunities for disposal and discharge of return cargoes of Australian coal at United States ports.

Statistics furnished, under date of February 1, 1914, by the secretary of the Pacific Lumber Inspection Bureau, Seattle, in regard to the British Columbia exports of lumber to Australia show the following marked contraction:—

	Ft. B. M.
1912 exports from B. C. to Australia	25,153,174
1913 exports from B. C. to Australia	9,967,980

Decrease in B. C. exports in 1913 15,185,194

It is stated that the total exports of Douglas fir from the United States Pacific coast ports and British Columbia ports in 1912 and 1913 aggregated as follows:—

	Ft. B. M.
1913 total U. S. and B. C.	238,773,612
1912 total U. S. and B. C.	199,074,325

Increase 1913 over 1912 39,699,287

The Douglas fir schedules disclose a very serious loss in trade to British Columbia, and it must not be overlooked that the returns do not include lumber exported from Californian ports to Australia, which comprises redwood, yellow pine, sugar pine, etc., amounting to about 40,000,000 feet B. M. per annum.

Ignorance of Planing Mill Costs

The title originally selected for this article was "Planing Mill Costs," but it was changed to the above, as more nearly expressing the true state of affairs. Does this seem like a strong statement? Then you, Mr. Mill-owner, Mr. Estimator and Mr. Superintendent, ask yourself this question, "How much do I really know about costs in my factory? Am I basing my estimates on definite, accurate knowledge, or merely on a guess which I believe to be correct, but do not know to be absolutely true?" Then give yourself an honest, straightforward answer and see if there is not a great deal of truth in that opening sentence.

Ask any mill man to tell you how he arrives at his costs and he is pretty sure to say: "I figure up the lumber, adding a certain percentage for waste, estimate the labor cost, and add the overhead, which gives the cost of production." Then pin him down to something definite. Ask him, for example, the labor cost on a box window frame, two lights, 20 x 32. The chances are he will say: "Well, that depends. It will usually cost from 35 to 60c, depending on the detail and the number made at one time. I generally figure an average price of 50c, which experience tells me is about right." You see, he does not know, but he does know that he can figure about 50c and strike the market about right, without knowing whether he is making money or not.

Why should this condition exist? Why should not the estimator be able to say: "It will cost 45c to make that frame," and know that the actual cost will be 45c? Surely, if one may spend money, he can determine exactly what he gets in return, and cost-finding becomes merely a matter of following money from the cashier's hand to the receipt of value therefor, whether this takes the form of actual merchandise, bought at a fixed price, or labor hours, paid for as such and measured by the amount of salable goods produced per hour or per dollar's worth of labor.

The question of the proper percentage of waste to add in figuring lumber was so ably handled by a writer in the March Wood-Worker that it will be no more than mentioned here, and that only for the purpose of relating a recent experience. Having occasion to name a price on some work involving about 15,000-ft. of lumber, the estimator, after figuring the number of feet required, based on random widths and regular lengths, added 10 per cent to cover extra waste. The order being secured and the amount of lumber actually cut being ascertained, it was found that the estimate was some 300-ft. short.

As this seemed to be excessive, the estimator investigated and found that the waste was owing to the fact that the lengths figured were not in stock at the time and could not be obtained without five to six weeks' delay, and it had therefore become necessary to cut lengths which would neither cut to advantage nor make cuttings which could be used for anything but fuel. This could not reasonably be expected to be known by the estimator, but if records had been kept and waste allowed for as outlined in the article previously mentioned, this excessive waste might still have occurred, but would have been allowed for.

The writer has been greatly interested lately in several books and magazine articles describing the system known as "Scientific Management." It is not intended to describe this system here, but it is an undeniable fact that whoever invented it knew something of cost-keeping. The method of operation seems to be to time every operation with a stop-watch and then analyze every movement, to see if there is a possibility of reducing the number of motions required and the time for performing the operation as a whole, with a consequent reduction of cost.

Just to see if we can learn anything from this, let us analyze the work of making a box window frame. The operations are usually as follows: 1—laying out and making a cutting bill; 2—surfacing lumber on two sides; 3—ripping; 4—cross-cutting; 5—molder; 6—trimming and gaining; 7—band-sawing such parts as arch bars, if any are used; 8—cutting pockets and routing for pulleys; 9—nailing up, which will include fitting-parting beads and (usually, unless of hardwood) inside stops and placing of pulleys. Labor cost is made up of these nine operations, and any estimate of cost should be based on records showing exactly how much time is required for each one, and a summary of the whole cost from beginning to end.

Here is where the cost-keeper can properly employ the methods of the efficiency expert. Let the time, in split seconds, be kept on every operation performed in the mill for a period of one year; the results tabulated and averaged; the number of productive labor hours compared with the total number of working hours as shown by time-books and pay roll, and we arrive at a working basis which could be made as nearly accurate as it is possible for anything human to be. It is absolutely necessary that the record extend over at least one entire year, because of the well-known fact that even the best workman will work faster when he knows that work is piling up ahead of him than he will when work is slack.

I have seen first-class mechanics dawdle along for half a day, perhaps, on a job which could easily be done in half the time, because they knew there was nothing ahead, and if they finished too quickly were very apt to be laid off. This is a very human trait, and one for which the workman is scarcely to be blamed, but the resulting condition is an element of cost which cannot safely be ignored by the person who undertakes to make and sell mill work at a profit. By averaging the yearly record the charges are distributed so that the extra cost of the slow, time-killing work is borne by the busy hours, a distribution which is absolutely necessary, as it is a practical impossibility to obtain higher prices during these periods of increased cost.

It has never been my privilege to see the actual working of any cost system worthy the name, and such descriptions as are obtainable seem to apply to almost any line of manufacture other than that of special mill work. The nearest thing to a system which has come under my personal observation consists of having spaces ruled on the back of the work ticket for a cutting bill, and other spaces printed and ruled for the workman to put down the number of hours and minutes spent on the particular job in hand, together with the name of the machine or hand operation being performed. As this was only required to be done on such orders as were taken without price, to be charged for on a time-and-material basis, the men usually overlooked putting down their time until the work was completed and then the foreman would put down about what he thought it should be. This was, of course, much better than no system at all, but very little, if any, better than the usual method, in which the man making the charge will "guess it cost about a dollar," and let it go at that.

The statement is often made that cost systems are too expensive; that the time and money spent in securing accurate data is more valuable than the information obtained. This is true of those systems which are content to stop with the simple finding of costs, but if used intelligently and made a permanent part of the factory organization, there is no good reason why the expenditure should not prove to be a good investment. If properly used, the cost sheets should not only contain an exact record of time and material used on each job, but show where the leaks are and what methods could be applied to stop them. There are few men with the intelligence of the average wood-worker who will not readily listen to and apply a timely suggestion tending to shorten the time spent on a given operation, or if properly encouraged they will offer such suggestions themselves.

Lest some one should believe that the foregoing remarks apply to a purely local condition, let a specific instance be mentioned: In

DISSTON

The Saw the Millman Looks Up to

It is the saw he depends upon if he wants to keep quantity and quality of output up and his manufacturing expenses down.

The high regard in which he holds this saw is a development from the year of efficient service which Disston Saws have been giving.

This appreciation of Disston Saws is not confined to any one country—wherever mills are converting timber into commercial lumber, there you will find Disston Band and Circulars Saws.

Our new book, "Saw Appreciation," tell why you should use Disston Inserted Tooth Saws. Free for the asking.

Branch at Vancouver, B.C.

Knight Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk 3 feet by 6 feet 3 inches
Diameter and Length Mandrel . 2 3/16 by 55 inches
Size Drive Pulley 20 by 10 inches
Feed per Revolution of Saw 0 to 3/4 inches
Feed Belt 4-inch Gandy
Largest Diameter Saw 56 inches
Length of Carriages 12, 16, 20 or 24 feet

Width of Carriages 33 inches
Trucks 7-inch wheels and 1 1/4-inch axles
Length Track 32, 40, 48 or 56 feet
Style and Opening of Blocks C1-36 inches
Style Mill Dogs Pony Excelsior
Style Set Works No. 1 Single Ratchet

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

Canadian Distributors:—R. Hamilton & Co., Vancouver, B. C. E. Long Mfg. Co., Orillia, Ont.

November, 1913, The Wood-Worker published a query from the writer regarding the costs of certain items of cellar door and window frames, the statement being made that information was sought for the use of our local Estimators' Club. At this writing not a single answer to this inquiry has appeared. Surely, if ignorance of this all-important subject was not well-nigh universal, some reader would by this time have given some kind of an answer. This goes a long way to prove the statement with which this article begins.—C. M. W. in The Wood-Worker.

Keeping Account of Cost on Errors

It was suggested some time ago by the writer that the cost of errors should go into the overhead expense, and should not be charged up to the jobs on which they occur. While I have never known this to be done, it is manifestly improper to acquire figuring units from cost sheets which carry a burden of error, says Chas. Cloukey in the Woodworker. But, you say, we cannot do business without making mistakes, and the customer will have to pay for them or the factory will have to lose them. That is true; but no piece of work is figured on a basis of certain error, and it is for this reason that every customer should be taxed with this necessary evil of doing business. The only way we can do this is to put it in the overhead and add it as a percentage to all of the work.

The subject of mistakes is one of the most perplexing and at the same time one of the most fascinating with which I have had intimate acquaintance. When we eliminate mistakes of ignorance and carelessness we have dealt with only those errors which we understand. It is a common saying that the best of men will make mistakes, and this is the real proof of our perplexity. Having made a close study of mistakes for about ten years, and having made little progress except to make a rather comprehensive classification, I am now delving into both psychology and metaphysics, and hope to get some real light on the subject.

However, I started out to say something about keeping a cost on errors, for if we do not keep a cost on them, how are we going to tell what to add to our overhead percentage? And another reason for keeping cost on error is to check against the offenders for efficiency. Even if the cost is not charged up to the men, the employer will be able to say when the employee asks for a raise: "Let me see; during the past six months your mistake account has cost us \$50—or perhaps it might be \$150. Do you really think we can afford to pay you more until this record shows a decided improvement?"

The means of keeping tab on mistakes is inadequate, and there are at least two reasons for this. In the first place, not every one has the backbone necessary to keep a record of his own errors, or even to report them if he can put his work across without doing so. In the second place, errors sometimes become so badly involved with the regular work that it is almost impossible to place the proper amount of expense on the mistake.

For instance, we often come across a small shortage in the quantities on the cutting bills, and this is not discovered until the work is ready to put together. Now, shall we go to all the trouble and expense of making out an error sheet, and carry it through the cost system and through the accounting system, to cover work that will take less time to get out than it will to keep track of the expense of it?

Common sense tells us that we should not spend more money to merely keep track of an error than it costs us to correct it, but the aggregate of these small errors will be considerable for a year, and should not be lost sight of. However, I believe there is a better way to handle them than to run them through on an order sheet. If the foreman of each department would keep careful notes of these small errors and turn them into the superintendent every day, they could go over the matter in a few minutes and determine the approximate cost, also the probable responsibility for the errors of the day or of the previous day, as the case may be.

Of course, this implies that each foreman would be absolutely honest about his own mistakes, also that he would not hesitate to report mistakes of the superintendent or the manager when they appear, for we all make them, and the number we make during a year's time would seem almost incredible if they were all bunched together in one place. Many of the mistakes are of little consequence in themselves, but, like little parasites, keep sucking away the profits and prevent a healthy growth of the business.

If it were not for the constructive ideas of management, for the institution of simpler and more economical processes, and the improvement in machines and methods, I believe that no complicated business like that of mill work could survive on a dead level. The steady run of error would kill it.

This is not intended for a pessimistic article at all, but is based upon a good many years' experience, and, as before stated, several years of special study of the errors made by all grades of men connected with the building business. And it is because of these con-

clusions that I believe that error should be treated as an institutional expense and put in the overhead charges of the business.

As a further illustration of how difficult it is to keep a proper error account, let us say that after a job has been completed and shipped the customer makes the discovery that he is short two windows, with their frames and trim, and a couple of inside doors, with their jambs and trim. We look up the plans and our listing, and find that we have overlooked these items and that they will have to be made and shipped as quickly as possible. Their omission is clearly an error, so we enter these quantities up on an error order number and put them through the mill. We get all the time and material on the sheet at the completion of the work, but it appears at once that we should not charge the whole amount to error, for had the items been handled with the others they would have carried the same amount of material, but should have had less time.

Now, to get at the real amount to charge to error, we will have to figure the unit cost on the first run and subtract that from the unit cost on the error run, which will give us the unit amount to charge up to the man who made the omission. Besides this amount, there may be the matter of freight. Suppose the customer is 500 miles away and the goods have been shipped in car lots. This last shipment must go local; the difference in rate is plainly chargeable to the same error.

Now let me give another case, which is still more involved and which actually happened: A fine stairway was gotten out and shipped to a neighboring city, and when it came to erection it was discovered that part of the balusters were wrong, and there were not enough of them. The correction was entered on an error number, and carried the full amount of balusters to complete the job.

Now we can see at once that this will not permit the same treatment as we have laid down for a plain error of omission, for the material and most of the time for the omitted balusters cannot be charged to error as they were to be furnished anyway, while all of the time and material of the lot which was wrong were chargeable to the error. In short, we have two classes of error on the same order sheet, and in order to distribute the cost properly we must figure the unit cost of the second run of balusters, and for the omitted ones charge up the difference between that and the first run, as we did in the case of the doors and windows, and for the spoiled ones charge up the whole unit price of the second run.

Well, it was only a few days until the unwelcome news arrived that this correction order of balusters was all wrong, too. "How the blankety-blank are we going to handle this?" says the manager. "Put out an error sheet on an error correction?" Sort of makes us want to hold up our hands now, doesn't it?

Another feature we are apt to lose sight of is the extra cost occasionally involved in making a mistake before the remedy can be started. Not long ago, in getting out the material for some complicated transom bars, one of the men ran some small moldings wrong side out, with the result that when the bench man went to put them on they projected $\frac{1}{8}$ -in. back instead of the same distance in front. The carpenter asked his foreman about it and he said to dress off the back until it was even. A row of dentil work was then put on and the pieces sanded and turned over to the men who were nailing the frames up.

The pieces would not fit into the frame as it was detailed, and they went to the frame foreman who had machined the parts, and he told them to rabbet the transom sill out so that it would fit in. This was done, and about the time they were finishing the first frame the man who had detailed and billed the work happened along, and the first thing that caught his eye was a row of dentils with the member above sanded off flush. The transom bar that was already fitted had to be taken out, and, with the others, had to be plowed out so that a projecting piece could be set in above the dentils. This time all went on the error sheet, but the time spent in making the erroneous corrections had already gone in on the original order number as being of too little consequence to make a fuss about, especially as they came up separately.

The matter of distributing the charge against the men who were responsible for this work is still another question. While it is a fact that if the workman who made the first error had followed the full-sized detail on his bill, the trouble would not have occurred at all, the first foreman should have known that the molding was wrong, and the second foreman should have known that the transom bar front was wrong, as he had the full-sized section through the bar and was even more familiar with the work than the carpenter foreman. The amount involved in this case was small, as there were only a few frames of this style, but it serves to illustrate some of the complications encountered when we attempt to count the cost of mistakes or fix the responsibility for error.

At an average cost of less than one cent per square mile, 15,203 square miles of Dominion Crown timberlands in the Northwest were examined last summer by forest survey parties sent out by the Forestry Branch of the Department of the Interior.

Camp Supplies

We make a specialty of dealing in supplies for Camps and have now some particularly good values in some of the more important lines such as Currants, Raisins, Dried Peaches, Evaporated Apples, Figs, Prunes, etc.

EDGINGS

Ontario

The handle factory belonging to Ira Webster at Florence, Ont., was recently completely destroyed by fire.

The Axe Lake mill, belonging to the Muskoka Wood Manufacturing Company, Huntsville, Ont., was recently destroyed by fire.

The tie and timber camps belonging to Alvin Thompson in Gorham Township, Ont., were recently destroyed by fire. Mr. Thompson's sawmill was saved with great difficulty.

Plans have been drawn for a new timber mill costing \$20,000 to be built by J. R. Booth on Chaudiere Street, Ottawa. Mr. Booth has also drawn plans for a new sulphite mill to cost \$35,000, which will be built on Bridge Street.

The Andrews Lumber Company, Limited, Sault Ste. Marie, Ont., report that their mill at Alona Bay was completed about the middle of May, when they started sawing operations to produce the necessary boarding and roofing for the building.

Reference was recently made in these columns to the fact that the McAuliffe Davis Lumber Company, Limited, Ottawa, Ont., were making additions to their Duke Street plant. The company advise us that the additions will be quite extensive. When the plant is completed, full particulars in regard to it will be published in the Canada Lumberman, with a view to furnishing information to others who may be contemplating similar construction in the near future.

J. E. Baechler, Goderich, Ont., reports that his new sawmill, to replace the one recently destroyed by fire will be 60 ft. x 90 ft., and will have a capacity of 25,000 feet per day. The new planing mill will be 60 ft. x 130 ft., two storeys, both of which will be equipped with the very latest and most up-to-date machinery on the market. The contract price of the building will be about \$12,000, and Mr. Baechler expects to have the plant in operation on or about July 15th.

The Muskoka Wood Manufacturing Company, Huntsville, Ont., whose mill at Axe Lake, Ont., was destroyed by fire on May 17th, report that they will replace the mill, but have not yet decided as to the style of mill which will be erected. They will settle this point about the first of August, and hope to have the new mill in operation by November 1st. The mill which was destroyed was used for cutting lumber in the winter season. The fire also destroyed the blacksmith shop, office, 14 sets of log sleighs, tank, snow plough and some other equipment.

A purely formal process necessary to transfer the assets of the Abitibi Pulp and Paper Company, Limited, has necessitated the former company going into voluntary liquidation. The proceedings have no other significance and the concern, under the new name, is continuing the construction of the ground wood mill at Iroquois Falls, Ont., which, it is expected, will be in operation next month. Excavation on the paper mill has also started. Four machines are being built for the plant, which will be running in June, 1915, and will have a capacity of 65,000 tons of news print per year.

A report which was recently published regarding "Driftwood Lands and Timber Limited," to the effect that it had acquired extensive mahogany and cedar lands in Dutch Guiana and intended to erect a veneering plant in Ontario, was unfortunately an error. The information should have been applied to "South America Cabinet Woods Limited." The latter company, which was recently incorporated with a capital of \$1,000,000 and head office at Toronto, has acquired 47,407 acres of mahogany and cedar lands in Dutch Guiana which are reported to contain a large quantity of mahogany, cedar, purpleheart and greenheart. The company will probably erect a large veneering plant at some lake point in Ontario, possibly Oshawa.

Mr. Duncan Chisholm, representing the Chisholm Corporations, Limited, has entered into an agreement with the Ontario Government for the purchase of the pulp wood on the Metagami River pulp limit. Tenders for this limit were received until the 31st December last, but none of the offers were acted upon at the time because certain conditions were not considered satisfactory to the government. One of the conditions of the tender is that the company shall instal a pulp mill costing not less than \$250,000 to handle seventy-five tons of pulp per day and employ not less than 200 hands on an average of ten months in the year. Crown timber dues of 40 cents per cord for spruce and 20 cents per cord for other woods are to be imposed, the Crown reserving a railway right-of-way, water powers, and granted lands.

Eastern Canada

The pulp and paper mills in Queens County, Nova Scotia, owned by Frank Stanfield, have just been sold to a syndicate.

The Shawinigan Water & Power Company, Power Building, Craig Street, Montreal, P.Q., are contemplating the purchase of 800 thirty-foot cedar poles, to be delivered within the next three months.

The sawmill of B. L. Moore, situated at Moore's Mills, eight miles from St. Stephen, N.B., on the C. P. R., has been destroyed by fire. Another sawmill in the district owned by A. J. Maxwell has also been burned down.

The sawmill belonging to Benjamin Ainsley at Thetford Mines, P.Q., was recently completely destroyed by fire. Very little insurance was carried. The mill will be rebuilt and the company will be in the market for new machinery.

Reports from various parts of the province of Quebec indicate that forest

fires were developing to an alarming extent during the second and third weeks of May. In the neighborhood of Ste. Agathe, an extensive fire broke out and did much damage to a quantity of timber which had been cut during the winter. Fires in various parts of the province were so extensive that the smoke was interfering greatly with shipping between Quebec and Montreal.

The Minister of Crown Lands for the province of Quebec has now given out details of the timber limits which are to be put up at auction on behalf of the government. Those which are to be sold on August 11 comprise limits, some of them up to 2,000 square miles in area, in the regions of the Ottawa, Harrican and Bell Rivers, Lake St. John, Rimouski, Matane, Bonaventure and Gaspé. The sale on October 20 will be of limits along the Mistassini, Ashpamouchouan and Rat Rivers. A condition of the sale of each limit is that a pulp mill must be erected on it within three years, of a capacity of five tons per day for every one hundred miles of limits.

Western Canada

The new mill erected by Carney & Benzie at Benton Siding, B.C., was recently completed and is now being operated.

Houston and Hanley have nearly completed the erection of their planing mill at Redcliff, Alta. The mill is to cost \$6,000.

The mill of the McLelan Lumber Company, Ladner, which has been idle for some months, has resumed cutting. It has a capacity in excess of 50,000 feet per day.

The plant of the Canadian Pacific Lumber Company, Port Moody, B.C., resumed operations on May 11th. Approximately 200 men will be given steady employment at the mill.

The city of Winnipeg has awarded a contract for cedar poles to Tomlinson and Mitchell, 711 Union Bank Building. The contract includes 500 forty-foot cedar poles at \$5.85 each and 100 forty-five foot poles at \$8.20.

The Shull Lumber & Shingle Company are considering the erection of a shingle mill with a capacity of one million shingles daily at Vancouver, B.C. The company's head office is at Everett, Wash. The mill will have an equipment of 24 shingle machines.

Timber limits on the north end of Vancouver Island have been sold to H. A. Whitney and H. W. Treat, of Seattle, for \$127,500. These were bought from Hampton & Edgar, who four months ago bought them from W. R. B. Ford, J. J. Halloway and R. B. A. Rogers, for \$98,000.

The Dunlop Pulp & Paper Mills, Limited, has been incorporated with head office at Selkirk, Man., and capital of \$1,000,000. Among those interested are F. A. Dunlop, 316½ Donald Street, and T. McHattie, 846 Main St. The company is given power to buy, sell and manufacture pulp and paper.

Fire at Three Valley Mill, twenty miles west of Revelstoke, recently destroyed three and a half million feet of lumber piled in the yards. The estimated loss is \$35,000, covered by insurance. The mill was not damaged. Three Valley Mill is the property of the Forest Mills of British Columbia, Ltd.

The Huntting-Merriitt Lumber Company, have awarded a contract for the erection of a sawmill at Eburne, B.C., to cost \$45,000. The general contractors are The Heaps Engineering Company, 325 Front Street, New Westminster, B.C., the superintendent of the work being Mr. J. J. Daley. The architect is Mr. D. B. Campbell, 413 Granville Street, Vancouver, B.C. The above-mentioned cost includes the building and machinery.

At the annual meeting of shareholders and directors of the Yellowhead Pass Lumber Company, Limited, Cranbrook, B.C., which was recently held, a report was presented showing total assets of \$715,524 and liabilities, including capital stock, of \$208,163, thus showing an excess of assets over liabilities of \$507,361. The report showed that the general financial situation of the company was very satisfactory. The president, Mr. A. Carney, Kaslo, B.C., and the other officers were re-elected. Mr. A. E. Watts and Mr. Isaac Burch were added to the board of directors.

Mr. Justice Morrison of the Supreme Court of British Columbia has confirmed the contract between the Western Canada Trust Company as receivers for the debentures—holders of the Ocean Falls Company and Messrs. Fleishhacker Bros. and Johnston, of San Francisco, by which the large plant of the Ocean Falls Company, situated 200 miles north of Vancouver is to pass under the control of a merger of the Pacific Coast Pulp and Paper interests. The contract is reported to have been endorsed by the debenture-holders at a recent meeting in London, England. The plant is one of the largest on the coast and is equipped with modern machinery for producing 140 tons of dry pulp per day. The sawmill in connection with the plant has been in active operation for some time. It is expected that the pulp plant will be again in operation in the near future. The Fleishhacker interests already control a large pulp mill on Quatsino Sound and another on Howe Sound, together with other pulp mills at various points on Puget Sound.

Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquiries by writing to the Department of Trade and Commerce and stating the number of the enquiry.

391. **Lumber.**—A well-established commission house in Barbados inquires for Canadian exporters of lumber.

398. **Wood splints.**—A Staffordshire firm inquires for exporters of splints suitable for match making.

423. **Timber.**—A Newfoundland lumber firm asks to be put in touch with British Columbia suppliers of timber and firm boards, etc.

441. **Wood, box shooks.**—A Durban firm of importers asks for samples and prices with full particulars on Canadian-made box shooks.

Slate-Flex Shingles

Are made of asphalt felt roofing covered with firmly broken slate and granite. The stone will not come off and the Shingles are guaranteed for twelve years. No attention is necessary after they are put on.

Sizes 8 inches x 11 1/2 inches

Made in five colors and are practically fireproof.

Timbers of the West

Douglas Fir—the World's Great Utility Wood—is in demand wherever wood is used. The present consumption, though great, will increase as the merits and values of this wood become more thoroughly understood.

Red Cedar—the World's Overcoat Wood—has no superior for shingles, siding, exterior trim or for any exterior use for which a durable material is needed.

Spruce—of the tidelands of Oregon and Washington, is in general request by sash and door makers while the lower grades are snapped up by manufacturers of fruit boxes.

The foregoing are some of the varieties of timber it pays to own.

Now is the time to buy them

Save All The Hand Fitting!

Use Shimer Cutter Heads in which the Bits are simply filed or ground to sharpen and set to a gauge—no more trouble than filing a saw. They eliminate hand fitting and make the men and machines so efficient that a quality product can be turned out in paying quantities. They save time, save labor, save material—do away with the fitting, trying and other annoyances, and cut so easily and clean that power is also saved. They maintain uniform patterns because the shape of the pattern is turned into the long-life Circular Bits and never changes when the Bits are sharpened.

Shimer Cutter Heads are provided with the latest developments in the art of reducing friction and wear on the knives. The Bits are bolted to Conical Duplex Bit Seats to secure perfect point and edge clearance. Working in pairs and in upper and lower series upon the Head, they divide the cut in a shearing manner, lessening the tendency to pull out knots and splinters on hard and cross-grained lumber.

The edge outline of the Bit only comes in contact with the lumber and shapes it accurately. As the cutters are filed or ground to shape on the inside of the circle the shape never changes. All that portion of the cutting edge is brought into service as the cutter is sharpened and brought around upon its holding bolt to again fit the gauge.

There's a Shimer Cutter Head for every kind of matching and moulding service. If you will state your conditions and give us measurements of your machine we will send you the proper tools on free trial. Write us today.

Address SAMUEL J. SHIMER & SONS, Inc., Galt, Ont., Can.

The "Shimer Limited" Cutter Heads, with Expansion, Fig. 627 and Fig. 628 FOR THE HIGH SPEED MATCHER

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new chisel point given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, \$72.46 the set complete.

Proper Selection of Belting

The remarkable improvement in the manufacture of leather belting, made necessary by the development of modern efficient machinery is of little avail if the proper selection and application of belting is neglected.

The use of unsuitable belting invariably results in increased expense due to one or more of the following objectionable features: Excessive or uneven stretching, slippage, undue friction in bearings, loss of power, frequent interruptions to machinery and consequent loss in production, to say nothing of the early destruction of the belting.

On the other hand the adoption of belting constructed to meet each condition of service, ensures low cost of operation and maintenance, as well as the maximum production from machinery.

There is one best belt for every drive.

- For Vertical Drives**—Belts of as light weight as is consistent with sufficient tensile strength to transmit the required power.
- For Quarter-Turn Drives**—Belts of special construction, those for quarter turn to left made different from belts to operate on quarter turn to right.
- For High Speed Work**—Heavy single belts with special laps, or light double belts.
- For Intermittent Loads**—Heavy belts with high coefficient of friction.
- For Exposure to Steam, Gas or Oils**—G & K. Spartan Belts, made from leather specially tanned and curried and put together with a special cement.
- For Exposure to Water or Moisture**—G. & K. Neptune and Spartan Waterproof Belts, put together with waterproof cement—the use of either brand depends entirely upon the construction of the drive.

From the foregoing, the absurdity of adopting one quality and weight of belting for all drives is apparent.

To meet different conditions of service we manufacture several brands of belting each

rigidly graded as to quality, weight and thickness.

Our engineering experts will gladly assist you in analyzing any type of drive or in the selection of belts calculated to render the greatest service. Consult us freely.

Subject for next month:—"Proper Selections of Belting" (Width, Weight and Quality.)

"Wilson Bros." Hardwood Flooring

is the Flooring that is manufactured expressly to supply the demand for the best. It is made by modern machinery from carefully selected stock, and every precaution is taken throughout our entire system to make it fulfill the requirements in every particular. Write us for prices.

Wilson Bros., Limited - Collingwood, Ont.

Transmit 100% of Your Power

Why pay good money to generate power and then employ a poor belt that will only transmit a fraction of that power.

If you equip your mill with Goodhue Belts you can transmit 100% of the power generated.

Goodhue Belts stretch 15 to 25 per cent. less than other belts, and have just the right amount of "cling" on the pulley.

Write us for particulars and prices

**YOU CAN DO
IT WITH— A GOODHUE BELT**

A New Swage The Best Yet

United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

Cling-Surface effects savings in more ways than you can imagine

Savings from the use of Cling-Surface pop up from many sources: Where belt slip is stopped without tightening belts and its attendant useless increase of bearing pressures, coal is saved in quantities, year in and year out, that pays for the Cling-Surface and its application dozens of times over. Cling-Surface treatment more than doubles or trebles the life of belts that otherwise are run tight, for the pliability and softness which it imparts to both interior and exterior permit the belt to run slack with less slip than is present in a tight belt.

The truth of these statements is forcibly emphasized in the following remarks of Mr. Jerry Lynch, 196 East 205th Street, New York, a self-styled "Cling-Surface Bug" who was put in charge of M. P. Davis' plant, Niagara Falls, Ont., where belts were once run extremely tight.

"They burned out many sets of main bearings on those compressors. After Cling-Surface came, I asked them to allow the belts to go on without taking up, which they did. We cut the oil bill from five gallons a day to five gallons a week and once ran for over three months without stopping, and no trouble."

Mr. Lynch was there 25 months. During that time they need only one gallon of Cling-Surface.

This is perhaps an exceptional case,

and an extremely high oil-saving record. But it is important in helping to prove Cling-Surface treatment the logical solution for belt troubles.

Belts partially ruined because of wrong treatment or no treatment can still be reclaimed with Cling-Surface, which, supplied correctly, nourishes all the good still in them and checks the deterioration. Ask anyone who is using Cling-Surface. Give Cling-Surface a trial or at least write for more information today.

We quote f.o.b. Toronto.

Good Lumber HORSES

Should be free from all blemishes

Use

ABSORBINE

for Wind Puff, Capped Elbow, Bog Spavin, Thoroughpin, Shoe Boil, Curb, Enlarged Glands and all puffs and swellings, Fistula, Poll Evil, Sprains, Contracted Tendons, Bruises, Lameness of all kinds.

ANTISEPTIC

You cannot get good work out of your lumber horses if they are lame, blemished, sore, sick or similarly unfit. The animal with Swellings, Soft Bunches, Bog Spavins or any such blemish, whether lame or not, needs your attention.

ABSORBINE

best friend—it relieves the horse of all pain, soreness and troublesome blemish. It makes the horse better looking, better working, more fit and of greater value to you.

You can work your horse at the same time. This is no new lotion but the tried and tested remedy of many years successful use. Thousands upon thousands of horses which would have been ailing and sick and unsightly have been made fit and well—good workers and good lookers. What others have done with Absorbine you can do, too. All enquiries on special cases answered without delay—full information and instruction on request. Absorbine \$2.00 a bottle at drug-gists or delivered.

Manufactured only by

ABSORBINE

does not blister or remove the hair, never leaves scars or blemishes of any kind.

It is easy to apply and does not require the horse to be laid up.

Highly concentrated and only a few drops required at each application.

Canadian Locomotive Company, Limited, Kingston, Ont.
Taylor and Arnold Ltd., Sales Agent, Montreal and Winnipeg

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

Radcliff Shingle and Band Saws

**"The
Saw
With
The
Keen
and
Lasting
Edge"**

The ability to produce high grade saws is a manufacturing fine art in which we are well informed.

Radcliff saws are without a superior. They are made in all types and sizes. Our shingle and heading saws are of an extra fine grade of steel, made expressly for the purpose, unexcelled for toughness, temper and cutting qualities.

Send for our catalogue.

The Mark*of Quality*

A MACHINE THAT IS WINNING

Our No. 2 Iron Saw Frame, a machine of comparatively recent design, built for **service**, is doing the business and meeting with the hearty approval of exacting mill men everywhere.

A glance at the cut tells half the story. See the rest in the bulletin. A post card will bring it.

"She Sure Does Run Smooth."

THAT is what a visitor at our works the other day said when he saw this mill being tested. This photo was taken at the time.

It is a 40-second exposure of a Waterous "New Model" Bandmill running at 10,000 feet per minute. It shows the mill running at full speed on the testing platform—without holding-down bolts.

Notice the clearness and sharpness of every detail of the columns, the guides, and of the top wheel.

That shows that there is absolutely no vibration in the mill. It means correct design, accurate construction, and good workmanship.

Do you wonder that we continually harp on the steadiness, the smoothness, and the true running qualities of our mills—or that we have sold more than twenty of them in the last five years?

The Waterous "New Model" Mill

has other outstanding features that are distinctively its own:

- ☐ It is self-contained upon its own frame.
- ☐ All operating mechanism, raising and lowering device, tilting mechanism, etc., are carried within the columns, free from flying sawdust, and always out of the way.
- ☐ Both guides swing about the exact centre of the saw-blade—no other guides on the market have this feature—it is patented.
- ☐ Upper guide is raised and lowered by steam cylinder.
- ☐ Tension device, is double-spring cushioned—the most sensitive device of this kind now in use.
- ☐ Built in 7 ft., 8 ft., 9 ft., 10 ft. and 11 ft. sizes.
- ☐ The mills sold have the endorsement of every user. Send us your address and we will refer you to an installation in your vicinity. Let the men who are operating the Mill tell you just how good it is. Their opinion is unbiassed, and we are ready to abide by it.

The
Waterous Engine Works Co., Ltd., Brantford, Can.

"FROST KING" METAL

\$5,000,000.00

worth of mixed metal
sold annually.

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.

Skefko "S. K. F." Ball Bearing

Automatically Self-Aligning

"Ball Bearings in Woodworking Plants," on page 48 of the June 1st Canada Lumberman, gives in a very clear manner some of the advantages of Ball Bearings for power shafting.

In the case of shafting which is not properly

The perfect operation of Skefko S.K.F. Ball Bearings under conditions which would put every other bearing out of business is due to the spherically ground outer raceway of the bearing. Note how the bearing acts like a ball and socket joint.

lined up or quickly gets out of alignment, the ordinary ball bearing is little if any better than a plain bearing.

The Skefko "S.K.F." Double Ball Bearing is automatically Self Aligning and will operate as efficiently under the worst conditions as if the shafting was in proper conditions.

Put your plant on the most efficient basis.
Install Skefko "S. K. F." Bearings.

Machinery and Timber For Sale

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the Town of Parry Sound, Ont.; and other Lumber Equipment, including boom chains, plows, sleighs, etc.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street.

We have the following Sawmill Machinery for sale:

- | | |
|---|--|
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | 1 Automatic Machine for circular saws. |
| 1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder. | 1 Hand Machine for cut-off saws. |
| 1 Double cylinder steam nigger, right hand. | 1 Lap Grinder. |
| 1 Log Loader for right hand mill. | 1 Set Band Saw Rollers and levelling blocks, with necessary swedges, a number of second-hand band, gang, edger and slash table saws. |
| 1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works. | |
| 1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs. | |
| 1 left-hand steam nigger. | |
| 1 Log-loader. | |
| 1 Endless chain jack ladder with two kickers complete for right and left hand mills. | |
| 2 Roger Gang Edgers for 8-in. cants and lumber. | |
| 1 Waterous double edger, 6 saws. | |
| 2 2-saw trimmers. | |
| 1 20-ft. Slash table. | |
| 1 16-ft. Revolving Slash Table. | |
| 1 Horizontal Slab Resaw with 5-ft. wheels, made by Diamond Iron Works. | |
| 1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit. | |
| 1 Lath Mill with bolter. | |
| 2 Lath Trimming Saws. | |

POWER PLANT

- | |
|---|
| 2 Double Duplex, high pressure Water Pumps. |
| 5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam. |
| 2 125 h.p. Water Wheels. |
| 1 Upright Engine for sawdust conveyor. |
| 1 10 h.p. Engine. |
| 1 Mitts & Merrell Hog. |
| 1 Wood Machine for 22-in. wood. |
| 1 Wood Machine for 16-in. wood. |
| 1 Edger for ripping dry lumber, installed. |
| 1 Edger for ripping dry lumber, not installed. |
| 1 30 h.p. Generator, 250 volt. |
| 1 30 light arc generator. |

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

Also, contents of machine shop, containing Planer, Drill, Lathe and Machinery, with tools necessary for repair work.

All of the above open for inspection at Parry Sound.

FILING ROOM

- | |
|--|
| 1 Automatic Filing Machine for 12-in. D.C. band saws. |
| 1 Automatic Grinding Machine for 8-in. S.C. band saws. |

ADAMS TOWING MACHINE

This machine installed in our pointer will do the work of a steam tug as well as many things a steam tug cannot do. The machine is strong and amply designed, burning coal-oil as fuel. Machine starts direct off coal-oil.

The pointer is particularly well built.

Ribs and frame are bolt fastened; they are made of well seasoned white oak, steam bent where necessary.

The planking is Louisiana Red Cypress.

Rubbing streaks are of hard maple.

The Adam's Pointer has proved a good investment for many lumbermen. Write for catalogue and testimonials.

Adams Launch & Engine Co.

Penetang, Ontario

When the Big Log Hits the Big Saw

Then comes the "tug-of-war." Instantly a terrific resistance is placed against the power equipment. That's the time when dependable belting counts. That's when the belting proves itself.

There's a difference between belt "price" and belt "service." One is what you pay—the other is what you get.

For sawmills there are Goodyear belts that cover every exact requirement from the main drive to high speed, small pulley machine.

Extra Power

For the main drive—edger and planer. Wonderfully strong. This belt shows the highest friction pull of any we have ever tested. Made of the heaviest and strongest duck of any belt we make—laboratory inspected and tested. The stretch taken out in the making. Highest grade rubber friction unifies the strong serviceable plies. Absolutely no ply separation. Made in various widths—"endless" when desired.

Imperial

Designed especially for high-speed and small pulley conditions. A fine belt for trimmer work.

Things to Know About Belting

Ninety per cent. of all belt troubles are due to using belting not intended for the purpose.

GOOD YEAR
TORONTO
BELTING
FOR THE SAWMILL

Other causes are improper installation, slipping and opening at seams and splice.

Before buying belting for any purpose remember that 15 years' experience is back of all Canada made "Goodyear" products.

Here we employ the same methods and equipment as at our Akron plant—here exists the same quality standard that has won Goodyear leadership in tiredom.

Here are efficiency experts who will be glad to confer with you on your belting problem as well as on those of hose, packings and valves. When buying any Goodyear equipment you buy service—and that's far cheaper in the long run than buying simply on "price."

Ask Goodyear to tell you just what product for the very purpose and why. Costs nothing to ask questions. Involves no obligation.

Write today.

32 inch Variety Turning Lathe

Solid and Inserted Tooth Circular Saws

We make a specialty of these lines

**We remake old Solid Tooth Saws
into new Inserted Tooth Saws**

Write to us for quotations.

Our saws have been before the public of Canada since 1855, and have won a reputation far excelling any other make of saws, combining as they do so many points of marked superiority.

By the old method the tempering of circular saws was to a great extent a matter of chance.

By our Patent Process that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 1

The Love Feast of Competitors

Only a few years ago it was the fashion for the aggressive manufacturer, who found his competitor was getting the best of him in the guerrilla warfare of rampant personal competition, to send a spy into the enemy's camp to purloin all the trade secrets on which he could lay his hands.

Today, however, they are not doing this in the best industrial circles. The lively little game of trade spying has passed out of vogue, along with dominoes, pinochle and pussy-wants-a-corner. Instead of sulking in his tent, dispatching trade spies and plotting against the industrial life of the other men in his line, after the manner of a chieftain engaged in barbaric warfare, the up-to-date manufacturer is attending the love feast of competitors and putting his fighting energies into a campaign for the good of the line.

These are the opening sentences in an article written by F. Crissey and published recently in the Saturday Evening Post. The writer tells the story of the development and growing importance of the trade association movement so well that we reproduce a portion of his article below.

In a word, Mr. Crissey says, the present-day manufacturer who is a live wire puts in more time attending the meetings of his association than he or his predecessors ever spent in scheming to steal trade secrets from competitors. Of course there are some survivals of the old school of mutual suspicion who still linger in the land of the Philistines and believe that every man's hand is against them; who continue to talk of the survival of the fittest; and look on all competitors as natural and unalterable enemies.

But these remainders of the old order are not representative of the present hour; they are out of pace with present-day thought and methods and their faces are set toward the past instead of being turned to the future and its cleaner, saner and more constructive methods.

Any man who is strong and broad enough to be a bellwether

in his particular business world will unhesitatingly declare that the modern association is the biggest and most significant sign to be found on the face of the whole industrial sky; that the love feast of competitors is the most important function on the business calendar of the down-to-date manufacturer; and that the association movement is an economic uplift that has already accomplished miracles of service to the consumer, the middleman, the manufacturer and seller of raw materials—and this in spite of the fact that the movement is practically in its infancy and has not yet had a chance more than to scratch the surface of the field of its potential usefulness.

The simplest type of trade association—Sitting at the modern love feast of competitors are to be found scores of men seasoned in the hard school of the old time head-hunting campaigns, who will unhesitatingly confess that it is immensely more self-respecting to sit in an association council and plan with competitors for measures that will cut costs, save waste and spy out new markets for the whole line, than it was to battle single-handed and wage a bitter and blinding trade feud against all men who had the effrontery to engage in the line of production to which they themselves happened to be devoted. These veterans declare that the ethical change ushered in with the association is perceptibly altering the moral map of the business world, and is the most widespread and wholesome influence felt in trade today.

There are more kinds of business associations today than of automobiles, but the type that claims the center of the stage is that composed of men or firms making the same general line of product or selling the same general line of goods. Associations of this sort are not only most numerous but undoubtedly contain the greatest possibilities for good and the fewest possibilities for abuse. At least this type of competitors' love feast is the most vital, because it is the most elemental and basic; it hugs tightest to the problems of quality and cost in production, of standardization and regard for convenience of the consumer and of economy in distribution. So let this kind of association come in for first consideration.

The National Hardwood Lumber Association is representative of the simplest form of this kind of trade crystallization. Not many years ago a husky and ambitious young man in Mississippi, who had worked in the hardwood cuttings ever since he could handle a cant-hook, wanted to get married. He decided that the shortest cut to a home of his own was by the sawmill route. He had a little capital of his own, and also the confidence of a local banker and timber owner; so he took the bit in his teeth, bought a mill outfit, collected a picked gang of workmen and started to saw his way to a happy home and a bank account. This young man knew the hardwood game from stump to freight car—but his knowledge stopped at the shipping-point. Beyond that lay an undiscovered country.

This, however, did not worry him. The big markets of the north were crying for hardwood lumber, and he soon found his desk full of letters and circulars from enterprising jobbers and middlemen who were eager to handle his output on a commission basis. They carefully explained their special facilities for disposing of his cut. "Nothing easier than this!" he thought. "All I have to do is to saw the lumber, sort it carefully and send it on the market."

He did sort it carefully, and his grading was done with the eye of good judgment and with the determination to make his market understand that every stick from his mill was right. The returns from his first carload made him smile with satisfaction. Then he consigned several more carloads to the same man. He received a wire saying that the consignment graded out in very unsatisfactory shape and that the grader's report would follow by mail. It did, and he took the train to Chicago, never doubting that he could personally establish the outrageous error of such grading; but he found that there was no appeal from the official grade placed on his lumber.

He returned home, having suffered an outright and heavy loss on the shipment. Then he tried other markets—sometimes with the conclusion that the grading was perhaps honestly done according to the standards prevailing in the particular market in question, but more frequently with the conviction that the small shipper was consistently trimmed and that the grading was the saw that did the trim-

ming. Each market not only had its own standards, but its graders were apparently under the influence of the men dominating that market. He showed his grit, however, and stuck by the game until he was almost bankrupt.

Then he contrived to sell his outfit to a man who had not been up against a grader's discriminating pencil. This defeated young man was a type of a large class. The small mill man who consigned a carload of lumber to the nearest market could never be sure that he would not have to send money after it to help out with freight and demurrage charges. And when he sold outright at destination his fate was still in the hands of the grader. On a down market his stuff was almost certain to grade poor. Large mill owners and big output buyers were by no means exempt from the scourge of unstandardized grading and the abuses that thrived under it.

All was chaos and disorganization. The small mill owner saw that he stood no chance against the big buyer in the distant market when that buyer chose to exert a sinister influence on the grading of a shipment. If the toes of the small mill owner had been the only ones stepped on the unstandardized practice of grading would probably have continued indefinitely; but when the men who jobbed the outputs of large mills realized that unstandardized grading was the big peril of the trade the National Hardwood Lumber Association was brought into being. Apparently the sole purpose behind this step was to eliminate this weapon that was always likely to be turned against the seller on a declining market, and put the grading of lumber on a uniform, standardized and impartial basis.

It was easy to effect an organization, but far more difficult to establish and enforce a system covering the whole country, and recognized and accepted by all buyers. Moral pressure and tight teamwork appeared to be the only practical means by which to force the adoption of such system.

To-day uniform grades—those determined by the National Hardwood Lumber Association—prevail in every market in the country. The smallest mill owner may have his carload of lumber graded by an impartial and disinterested inspector in the employ of the National Association and have no string tied to him. Whether he sells or con-

signs his shipment, he is sure that he need not be whipsawed by the old trick of crooked grading; for all he has to do to secure inspection at the hands of an association man is to ask for it.

After describing a number of similar cases in connection with other industries, Mr. Crissey writes as follows:—The cases to which I have referred are typical of thousands of others; almost every industry yields sharp, conclusive evidence that the trade feud is one of the most destructive elements in commercial and industrial life.

Cost accounting is to-day a science that demands a specialist of peculiar training and experience; and this highly specialized service is expensive. The smaller manufacturer naturally feels that it is beyond his reach, and this hesitation throws an advantage into the hands of the large manufacturer who can afford such service.

When an association of manufacturers making the same line of product employs such a specialist, however, not only is the cost to each individual member greatly minimized, but the system that is worked out has the advantage, when put into operation, of uniformity. The smallest member of that association measures his costs with the same yardstick the largest manufacturer is using.

Mr. Crissey's treatment of this subject, while referring to conditions that have developed in the United States, may be applied with equal force to Canada, and especially to the lumber business in Canada. Continued efforts which the Canada Lumberman made, over a period of nearly two years, to bring out enough sentiment to establish grading rules of the principal Canadian lumbers, were of no avail, because the Canadian Lumbermen's Association, at their annual convention did not show sufficient interest. In the face even of this indifference, we are as certain as it is possible to be in this uncertain world, that we were on the right track. The same evil to a regrettable extent, as that referred to above, exists in Canadian connection with grading many of its important classes of lumber. The association movement in the Canadian lumber industry is still young, but the day will probably come when associations will realize that they have been neglecting one of their most important aids to success, by overlooking the grading question.

The Retailer and the Salesman

Lack of salesmanship has been pointed to many a time as the chief obstacle in the way of conducting a profitable business and as an important factor in raising the cost of manufactured products—among them lumber—to the consumer. A recent editorial article in this journal referred to this matter at considerable length and discussed the injurious effect upon the trade caused by frequent calls being made upon customers by travellers whose chief object is to take orders instead of to give value to the customer. There is no question whatever that retail lumbermen and other large consumers of lumber stocks, have to spend a great deal of their time in conversation with travellers to whom they cannot or do not wish to give orders. They would welcome any reasonable reform in business methods which would enable them to dispense with this unprofitable consumption of time, but they are unable apparently to do so.

The article in question dealt largely with the salesmanship side of the situation and had little to say about the buyer's influence. A subscriber, who represents a large lumber manufacturing firm, after reading the article, expressed the opinion that something had been omitted and that reference should have been made more extensively to the retailer and the other large consumers, in regard to their attitude to the salesmen. When one looks into the question closely, there is no doubt that this feature of the case deserves attention also. In fact the whole matter resolves itself into a question of studying the different factors in connection with buying and selling lumber, both in a wholesale and a retail way, so as to get at the most efficient manner of bringing about trade, at prices which induce further trade and with stocks that encourage continued custom.

The personal element comes into play from the very first and the business policy of the retailer or the large consumer has a great deal

to do with the manner in which he is approached by the travelling salesman. It is possible, we believe, to adopt towards the salesman a line of conduct which will show him clearly just what kind of treatment he may expect when he calls again and will relieve him of all that uncertainty which makes it necessary to solicit trade time and again without results, in the hope that some day he will be fortunate enough to drop in at a time when there is a good chance of getting an order.

The manner in which a retailer greets a salesman has more to do with the former's success as a business man than he might be inclined to admit. The salesman is generally quick to size up his prospect and to decide as to the best means of securing an order. He will probably come first of all to an opinion as to whether the retailer wants good stock, even though he has to pay a stiff price, or whether he is looking for bargains, irrespective of whether the stock will give satisfaction to his own customers. No retailer will blindly purchase stock which he knows is not saleable, but many a retailer will make a mistake in buying stock which he thinks will be saleable and which is offered at an attractive price; finding out later that he cannot make a profit on it. This is where his treatment of the salesman is important. If he secures the confidence and sympathy of the salesman, the retailer may depend upon him to post him intimately as to the stock which is being purchased. He can get this confidence from the salesman without any difficulty if he shows that it is appreciated. The way in which to secure it is simple, depending entirely upon treating the salesman frankly and letting him know, in just so many words, what his requirements are, or that he is not in need of fresh stock at the time being, but may require a certain class of stock a little later on.

Selling lumber to the retailer ought to resolve itself into these

simple elements and ought to eliminate all those wasteful discussions which have to their object the drawing out of information that some retailers seek to retain. The retailer who acts in a secretive manner with a traveller is in most cases doing himself an injury. In the first place he is compelling the traveller to go away without the information he requires, and is making it necessary for him to make further calls later on. These are the calls which result so often in a retailer having a line of travellers waiting upon him and taking up much of his time, when he is very busy. There are offenders on both sides of the trade—retailers as well as salesmen. The former have mistaken ideas sometimes of their own importance, or as to the proper way of doing business. The latter follow too often the erroneous principle of seeking to make a sale, not only in the face of opposition on the part of the retailer, but also by methods which involve either sacrificing all profits, or delivery of stock which is off grade. These two classes of mistakes are responsible for many of the criticisms which one hears in periods of dull trade and it is difficult to say whether one of them is more serious than the other.

Having had something to say already about the salesman and his sins, it is fair that we should present the case from the other point of view as well, and appeal to the retailer to act towards the traveller in a more considerate and businesslike manner. This does not apply to retailers as a body. They are not all offenders. There are many who are recognized as past-masters in the art of getting value for their money and of keeping the respect of the travellers who call upon them, but there are many also who might mend their ways to their own advantage and to the great relief of the travelling salesmen. It is a most unpleasant matter for a salesman who has a certain amount of time available for a call upon one of his customers, to find that he is kept waiting uselessly by a man who thinks that he must, first of

all, impress the traveller with an idea of his importance. Such tactics never do any good. They incense the traveller and fill him with an impression the direct opposite of that which the retailer probably desired.

After all, a transaction involving the sale of a stock of lumber, is a business matter. It is not, as some might imagine, a struggle of wits. It should not involve a lengthy discussion. It can be reduced to its simplest terms by a process of question and answer in a surprisingly short time. The traveller is above all things a student of human nature, but there is too much of a tendency now-a-days to magnify the importance of the traveller's insight into character. Travellers too often pride themselves upon their ability to size up a customer, and customers too often pride themselves on their ability to stave off the traveller or drive a close bargain with him, by giving the impression that they are not anxious to buy. These methods come dangerously close to the margin of sharp practice. They are all well enough in a small way. They must naturally form a part of a large proportion of transactions, but their importance should not be magnified to such an extent as to make them the chief factors in the deal. What the trade lacks to-day more than anything else, and what it must secure if it is to be lifted out of the unsatisfactory condition into which it has grown, is a better understanding of essentials in connection with a transaction and a better appreciation of the relative importance of the incidentals. The essentials are, frankness in giving and receiving information as to requirements and as to stocks in question, together with the treatment of one another as necessary factors in the carrying on of business. The incidentals are the studying of character, fighting off competition, and in fact all those efforts of so-called business strategy, which are alright in their place, but which, when they are allowed to bulk too large, become a menace to the trade.

Dry Rot in Timbers a Serious Menace

In another section of the present issue an article appears which deals in an interesting manner with the problem presented by the development of dry rot in mill timbers of shortleaf and loblolly pine. The question has been dealt with in many of its aspects in this journal on previous occasions, but the article in this issue is of much importance and should be read carefully by all who are interested in the use of yellow pine. It goes to show clearly, as we have often pointed out, that longleaf yellow pine is an excellent material for use as timber in mill building construction, but that the shortleaf and loblolly varieties, which are so often mixed in with the longleaf and are so difficult to distinguish from it, are unsuited for this purpose, and are in fact a source of grave danger. The question is entirely one of eliminating dangerous timber which is subject to dry rot, and seeing that it is put only to uses in which its susceptibility to this disease is of little or no importance.

If the statements made by the author of this article are correct—and they are borne out by results which have taken place in Canada of late years—it should be considered a criminal matter to mix shortleaf or loblolly among timbers which are supposed to be longleaf and are to be used in the construction of buildings. It is only about a matter of a month ago since a large firm of contractors in Montreal was subjected to a judgment amounting to \$71,000 in a case where they were charged with substituting the shortleaf timber for the longleaf. In this particular case, after about a year from the time when the building was erected, it was found that dry rot was weakening the timbers and it became necessary to replace many of them with steel. The defendants claimed that they found it impossible to secure sufficient of the longleaf timbers to fulfil their contract at a reasonable cost. The responsibility connected with this matter, and the indisputable fact that good timbers can be secured at reasonable cost are clearly brought out in the article in this issue, and these facts make it seem reasonable that the government, or others who may be in a position to regulate the use of timbers in mill buildings, should take some steps to place this responsibility exactly where it belongs—namely, upon the party who first intentionally substitutes the dangerous tim-

bers for the good ones. In order that such a regulation or law could be put into effect, it would of course be necessary to have the two classes of timbers very definitely distinguished, and the suggestions which have been made by the writer of the article referred to indicate a manner in which this may be done. They also indicate the manner in which the shortleaf and loblolly timbers may be made practically safe for use in mill buildings, by subjecting them to a preservative treatment.

Yellow pine is playing a most important part in the timber trade of Canada today and the complaints about the substitution of dangerous shortleaf and loblolly have become so general and so widespread that those who are engaged in the timber trade are commencing to study the question closely. They will find a great deal to interest them in the article referred to, which will help them to a better appreciation of the difficulties connected with the matter. By insisting upon the use of longleaf or similarly durable timbers, wherever these are called for and by posting themselves as thoroughly as possible in regard to the distinction between the two classes, they will help in preventing the importation of the dangerous timbers into Canada. This importation has reached great proportions during the last few years and will grow still greater unless those who are concerned take a personal interest and do what they can to see that architects, contractors and others, who are interested likewise, are impressed with the risks which they run by laxity in regard to the quality of the timber they may use.

On July 1st, the steamship "Robert Dollar," laden with 5,000,000 feet of Douglas fir, from the mills of the Genoa Bay Lumber Company, Genoa Bay, B.C., will pass through the Panama Canal en route to an Atlantic Coast port from which its cargo will be hauled by rail to Toronto. This will be the initial installment of 25,000,000 feet of Douglas fir to be used in extensive harbor improvements under way at Toronto. This shipment of Pacific Coast lumber marks an epoch in the trade that is viewed with varying emotions by the lumber manufacturers, east and west.

The Reader's Viewpoint on Trade Topics

Ottawa Valley Firms Having Trouble with Drives—Interesting Reports on Market Conditions

Ottawa Valley Conditions Unfavorable

Editor Canada Lumberman:

Hull, P.Q., June 5th.

We cannot speak of trade conditions exactly, so far as others are concerned in the Ottawa Valley, but we understand that the conditions generally throughout the Valley are about as bad as they can possibly be. We would not like you to quote us as speaking for others, but we understand, according to report, that some of the Ottawa Valley firms have met with serious conditions, fires having destroyed a large quantity of their timber and some of their dams for passing logs through the rapids and falls. This has allowed the water to escape and has prevented successful driving.

On our own river, the Gatineau, fully one-half of the logs we are driving, we have no expectation of receiving this year. The Ritchie mill at Aylmer has been destroyed by fire. Some of our neighbors will be in an even more serious position than ourselves unless very heavy and unusual rains occur within the next few days.

These conditions, which seem to prevail generally, must affect the market to a considerable extent. Trade at present is in such a condition and buyers are of such a state of mind, that it may be some time before they begin to realize what are the facts. So many adverse factors and peculiar conditions prevail in these days that it is very difficult to prognosticate as to the future of the market. We cannot help but look for an improvement in trade. We think the worst must have passed.—Ward C. Hughson (Gilmour & Hughson).

Expect Reduced Cut in Ottawa District

Editor Canada Lumberman:

Ottawa, June 3rd.

In connection with the driving situation, the time has arrived to find out what effect it will have on the production of lumber and the market situation this year, and we are satisfied that you will find some interesting conditions of affairs if you look closely into it at this time. Firms which have very short drives on large streams will not be affected. In many districts however where lumbermen have to drive out their logs from creeks or small rivers into the large waters, we understand on reliable information, that there are not a few concerns who will not get their logs out. If you canvass the Ottawa situation closely, and if they will tell you accurately how the situation stands with them, in our opinion you will find that the great bulk of their logs manufactured last winter are not going to get out. One of our largest manufacturers here informed us three weeks ago, that unless heavy rains came at that time, 600,000 of their logs were going to be held up. Conditions have not materially changed since that time. We understand another firm in Ottawa are tremendously concerned with the condition of the Gatineau River. By a close canvass it is possible that you will find the driving situation such as to affect materially the amount of lumber that will be sawn this season and thereby certainly affect the price of stock.

Firms which are now depending upon the rains to bring out their logs, may conclude that they are not coming out, because the time has gone by for rain to improve the driving situation materially.—Manufacturer.

Drives Hung Up on Small Streams

Editor Canada Lumberman:

Ottawa, June 5th.

We understand that there are quite a number of drives held up on the small streams, owing to lack of rain and shortage of water. As far as our own logs are concerned, they are all laid on Kippewa Lake, and, of course, not having any small streams to drive we do not experience any trouble from the lowness of the water.—Shepard & Morse Lumber Company.

Ottawa Drives Will be Smaller

Editor Canada Lumberman:—

June 8th, 1914.

Driving conditions in the Ottawa Valley have been poor this year. The long cold spring allowed the snow water to run away, and since then we have had no rains until very lately, and what we have had have not been sufficient to give any flood of water. None of our creek drives on the lower Ottawa are yet out, in fact some of them are hung up for the season. Drives in the Temiskaming district are progressing better as far as the creeks go, but logs coming into Lake Temiskaming this season are not expected to reach the mills until the following year, so that this will not have any effect on the supply of logs this year.

The most serious condition, however, is that the main Ottawa

itself has been low this season, and not high enough to bring down the logs stranded along its shores, and the water is now falling fast with the result that a comparatively small portion of the 1913 logs have been moved any distance. Unless continued heavy rains are received shortly the outlook is for a short supply of logs.—Ottawa Valley Manufacturer.

Think the Ottawa Drives Mostly Safe

Editor Canada Lumberman:

June 5th.

We have experienced considerable difficulty in getting out our logs on all streams tributary to the Ottawa, and in fact are not absolutely sure yet whether we will get all our logs or not. However, we are satisfied that we will get at least ninety per cent of them. The season has been particularly dry, and one which has called for extreme caution and continuous vigilance on the part of foremen drivers and we consider ourselves fortunate to be in the position in which we are to-day. We do not think there will be any drives of any consequence stuck in this valley, and cannot see how it will influence prices to any extent.—Manufacturer.

Poor Driving Conditions on the St. Maurice

Editor Canada Lumberman:—

Montreal, June 8th.

At the present time there is little of a cheering nature in the lumber trade in this province. The supply of logs may be considerably less than normal this year, as the prospects for stream and river driving are none too promising. In the St. Maurice Valley especially, there will probably be a shortage of logs. We hear that the St. Maurice people have been obliged to leave a good many thousand logs behind on that account. We ourselves have had to leave behind in the neighborhood of 50,000 logs.

Shipments of lumber to the United States from our district have been very small and some of our customers whom we have met recently do not anticipate a very large trade during the coming season. Pulpwood conditions seem to be worse with our company. Prohibition, by our local government, of the export of wood cut on Crown Lands, has had no effect at all upon this trade, and it looks as though the paper industry has more wood than it needs at the present moment. I myself believe that the government made a mistake in imposing such a restriction, as the United States is about the only market where pulpwood can be shipped with any advantage.

There is no great activity in wood products generally. Reports of building construction show a decrease, compared with a similar period last year and weakness is generally prevalent throughout industrial and commercial centres.—Quebec Manufacturer.

Moderate Trade at Exeter, Ont.

Editor Canada Lumberman:

Exeter, Ont., June 3.

In talking with a number of lumber salesmen we have come to the conclusion that their trade is not over brisk, yet we have all we can handle in mill work, employing the same staff as we had last year. Our yard business is slack in the lumber and shingle line. Early in the spring we were looking forward to a busy season and we purchased our stock accordingly, and therefore have been buying very little in the last two months, as we are trying to work off what we have on hand.

As far as we are concerned, we attribute the falling off in yard business to the heavy demand on lumber and shingles during March, 1913. Owing to the wind storm at that time a large number of buildings, which would have been good for a year at least, had to be repaired, and we have not looked forward to as heavy a demand. As the present season was late, carpenters could not get any new work in hand and this made matters worse. We are not looking ahead for any large orders for either lumber or shingles, but if we could get the right class of men we could handle at least double the amount of our mill work, as we have turned down a number of large contracts because we could not handle them.—The Ross-Taylor Company, Ltd.

Retail Trade Slow at Kendal

Editor Canada Lumberman:

Kendal, Ont., June 5th.

We have never found the retail trade so slow as it is at present. There is practically no trade in this district. The wholesale trade is just as slow, only we have sold at a cut price to a firm with whom we have been doing business. We believe that the revival of trade will depend largely upon the crop. Money is very close. The wind storm a year ago has put an extra large stock of lumber on the market this

year. Cement, as a substitute, has largely replaced lumber. We do not now sell 16,000 feet where we used to sell 20,000 feet for flooring for outbuildings. Even municipalities are replacing bridge flooring with cement, constructing their bridges entirely of cement. We can see no remedy for this except a revival of the building trade, which may take place if money becomes more plentiful. The great stringency in the west has much to do with the trade situation. The largest implement firm in Toronto informed me that their collections in the west last year did not exceed 30 per cent. on their sales and that at the present time 60 per cent. of their trade is foreign.—A. Jackson.

Logs Not All Out of the Drives

Editor Canada Lumberman:— Canonto, June 2.

From what we can observe in connection with the stocks of lumber moving in this district we are not able to report favorably upon business conditions at present. Trade is not even normal and we find collections slow. Driving conditions have been bad this spring, owing to low water. Up to the present we have been able to get in only about two-thirds of our logs. Other operations in our district are in the same situation, some of them worse. With heavy rains in June, we may be able to finish our drives, otherwise some of them will have to remain over for another year:—Lawrence Bros. Limited.

A Bright Spot in the Trade Situation

Editor Canada Lumberman:— Kingsville, Ont., June 4th.

Our planing mill business this spring in connection with the house building demand is 20 per cent better than in any previous year during the past fifteen years. The barn building in our district is rather slack, owing to the very low price paid for tobacco. This effects the retail trade and the sawmill trade to a certain extent, but our wholesale trade in hardwoods is keeping up very well, with the exception of red and white oak, the demand for which is very slack, as a great amount of red and white oak is shipped in from the south. All other hardwoods are finding ready sale and we are well pleased with present conditions of trade and the future prospects. It may be the case that the retail trade is slow throughout Ontario. This would be because retailers are using a great amount of southern pine as a substitute for our white pine, hemlock and spruce, which have been running high in price.—David Conklin.

Looser Money Needed by the Trade

Editor Canada Lumberman:— L'Amable, Ont., June 2nd.

The amount and quality of lumber cut in this district during the past winter is, I believe, up to the average. The majority of mills are pretty well cut out. Basswood appears to be the best seller and in greatest demand, the price being apparently as good as in former years.

Birch and maple have fallen off to some extent in price and the demand is slow. Hemlock, ash, spruce and balsam are selling more readily than birch and maple and are bringing corresponding better prices.

While the lumber market is less active than usual, the cause seems to be the general financial depression rather than the lowering of prices. The building trade seems inactive every where and this undoubtedly has its effect upon the lumber market. I believe that with the loosening of money, lumber will sell freely and at good prices.—A. W. Gordon.

The Forest Products Exhibition—A Criticism

Editor Canada Lumberman:— Ottawa, June 3rd.

The Wood Products Exhibition recently held at Chicago and New York undoubtedly did good work in educating the general public to a better appreciation of the importance of the lumber industry in America. The general result was marred by one feature which was everywhere evident. Reference is made to the keen rivalry between the associations representing the manufacturers of the different kinds of wood exhibited. Instead of concentrating their efforts on demonstrating the value of wood as opposed to its substitutes, steel, concrete, brick and stone, their whole idea seemed to be to boost their own particular kinds of lumber and to knock that of their rivals.

It would be of more value to the lumber trade to convince the public that a slow-burning construction in a building gives greater safety in case of fire than steel and concrete, than to confuse the popular mind with a long drawn-out controversy concerning the relative strength values of long-leaf pine and Douglas fir. In the booth where the virtues of northern white cedar were lauded to the skies was a lonely photograph of a reinforced concrete telephone pole that had snapped off short with the strain of ice coating on the wires. This photo and the valuable object lesson it gave were in an obscure part of the booth instead of being the feature of the exhibit and the demonstrators in the booth confined their efforts to depreciating the dur-

ability and taper of poles of Idaho red cedar. California redwood was boosted on account of the fact that it lasted almost indefinitely when used for tanks and vats in tanneries when any sound wood would last under similar circumstances. The fact that wood was much superior to metal for this purpose was not mentioned. This fact of the relative durability of different woods was featured in a large number of the exhibits when the fact of the matter is that wood is not a durable material except under certain conditions and in most cases does not last as long as concrete. The important qualities of wood; its softness in relation to its strength, the ease with which it can be shaped and its lightness, were not discussed at all. If it is the intention to hold these exhibitions annually or even periodically the importance of co-operation against the common enemy of the lumber trade, substitution, should be impressed on the exhibitors. If the exhibition is made the centre of strife between manufacturers of different classes of lumber the average man on the street will go away with the impression that very little is really known about the relative properties of the woods of different trees.—R. G. Lewis.

Canadian Lumber in United Kingdom

Opportunities Likely to Increase with Opening of Panama Canal—Obstacles which have Prevented Expansion

Export markets for Canadian lumber are the subject of further reports published by the Department of Trade & Commerce in its weekly report under date of May 26th. Mr. Harrison in a report upon the trade for British Columbia lumber at London, England, says:

"The views of a number of representative timber importers have been sought with the object of ascertaining the possibilities of developing an increased market in this country for British Columbia lumber. Those consulted included not only strictly United Kingdom houses, but also firms directly connected with Canada.

"The abrupt decline from the phenomenally high freights which ruled until the autumn of last year affected the timber trade perhaps more than any other, and the reaction from the buoyant conditions which prevailed has been more than usually severe. The break occurred at a time when the trade was carrying large stocks of timber of all kinds laid down at high prices, and has been succeeded by a period of almost uninterrupted inactivity and dullness. Freights remain at a low level, and at the moment there are no definite indications of a revival.

Severe Competition

"British Columbia lumber—which, as far as Great Britain is concerned, practically means Douglas fir—has always had to encounter severe competition in this market, largely owing to the heavy transportation which it has to bear in comparison with other sources of supply of similar materials, and up to the present its consumption has been restricted because its use has been chiefly confined to certain specific purposes, although the scope is extending, and there is no reason, except that of price, why it should not be largely increased. So far its chief competitor has been pitch pine, coming mainly from the Southern United States.

"As the lumber trade is probably the oldest branch of Anglo-Canadian trade, it has been thoroughly exploited, and the timber importers and dealers of the United Kingdom, many of whom are directly represented in the principal shipping centres of the Dominion, are not only thoroughly posted regarding the fluctuations of the Canadian and other markets, but many of them possess an extensive personal knowledge of Canada's forestry resources; while a number of the principal Canadian shippers either maintain agents on this side, or regular correspondents, with whom they are in constant communication.

"Although the Pacific is of later growth than the Atlantic industry, it would appear that the principal importers here are well posted regarding the conditions prevailing in British Columbia, and the consensus of opinion is that no increase is possible at the present time.

"It is reported that there are several cargoes now in transit from British Columbia for which no buyers are in sight, and which, when eventually sold, are likely to realize prices which it is feared must be unremunerative to shippers, while any attempt to increase shipments can only result in heavy losses, until the prevailing depression passes away.

"Some critics consider that the industry is less well organized in British Columbia than in certain other sources of supply, and that until the present heavy cost of labor can be reduced, the industry must be heavily handicapped."

Mr. E. D. Arnaud, in a report upon the trade at Bristol, England, says:—

"As the result of a full inquiry into the subject it has been found that the chief obstacles to an extended use of British Columbia timber are the cost and length of time required to bring it here. Consequently it cannot compete at present with timber from Russia and Swedish sources, but it is fully expected that with the opening of the

Panama canal and a great reduction of the freight charges, together with the acceleration in the time occupied in the voyage, it will become profitable to use larger quantities of British Columbia timber in the future. At present it is doubtful whether any Bristol channel timber firm would care to undertake to import a whole cargo on the terms now offering.

"A matter that has, on several occasions, been brought to the attention of this office as operating to the detriment of the Canadian deal trade is the apparently careless way in which the deals are made, especially in the product of New Brunswick mills, and it is very essential that absolute accuracy in measurements be maintained, otherwise loss will occur in the subsequent cutting up on this side. Canadian deals are often found with waney edges, and this also entails loss, from which, it is stated, Baltic deals are entirely free, and consequently in greater favor in the market here. It should not be a difficult matter to overcome these defects that are complained of as lowering the value of the Canadian product.

"In amplification of these remarks, the following extracts from correspondence with several leading firms in the timber trade may be quoted:—

A Bristol Importer

"About three or four years ago the lumbermen in British Columbia and Oregon were full up with business, as the local demand was practically in excess of the supply. Since then, however, the lumbermen have been increasing their output on their home trade. Owing to the general slump in Canada which followed, they are now looking for an export market, and are keen to sell to the English timber merchants, through, of course, the usual brokers. Columbian and Oregon pine, however, are not in common demand on this side, and only one or two London or Liverpool buyers would entertain a contract for a cargo. In the Bristol channel it would be quite impossible to sell a whole ship load. If prices were right, I have no doubt that we could sell little lots at 25/40 standards to some of the more enterprising merchants, but the great drawback hitherto has been the high price and the long time taken to deliver, sometimes nine to twelve months.

"When the Panama canal opens, we are hopeful that with the shorter time taken for delivery, we shall be able to open up a business with the west coast of America, but of course prices must be right, and this is, and has been, the great difficulty to contend with. I have figures before me quoting \$18 per M. feet for Oregon pine, select lumber, and the freight to Bristol would run to about 75s per standard. This means that with the commission added, this grade of lumber would cost quite £12 2s 6d per standard, and then the goods would have to be worked into floorings. At the present moment the prices for Norwegian floorings, planed two sides and edges, is £10 15s, £10 17s 6d per standard, so you can see that if the Oregon select pine is to contend with the Norwegian floorings, there must be a considerable drop in price. You will observe that the freight from the west coast to Bristol is quoted 75s, and the ordinary freight from Norway to Bristol is about 25s to 30s at the outside.

"If we put Oregon pine in competition with pitch pine there is just about the same difficulty. We are not so conversant with pitch pine, as comparatively little is brought into the Bristol market, but we judge that if Oregon pine is to compete with pitch pine prices, the price must be considerably lower than at present.

"To sum the whole matter up; the fact is, the west coast lumbermen have put up mills, and they cut lumber in excess of the present requirements, and they are looking to the Canadian government to help them out when all they have got to do is to meet the market price on this side, and sell their stocks to the best advantage that they can. This means, of course, a sharp loss, but they must put this loss against the good times that they have had in the last three or four years.

"When the Panama canal opens, I shall be glad if you will put us in communication with some of these mill men who now want to sell their stocks, and I believe we could build up a fair trade with them in the Bristol channel, also in Liverpool and London."

"There has been, for many years past, a market over here for British Columbian woods, but the business has always been restricted owing to the length of time it took to come over and the high price of freight. If the Panama canal gets over this difficulty there is of course reason to think that there should be an increase in the business done. It would be of interest to have prices from the exporters (if it is yet possible) based on the prices that may probably rule for freight when the canal is open."

From a Newport Firm

"There are, as you are aware, large quantities of this timber coming into the United Kingdom, but, owing to our having been able to obtain our requirements of American large logs in pitch pine, we have not so far embarked in the Columbia import trade to any extent. Owing to the long voyage, this wood comes in somewhat unwieldy cargoes, but we have no doubt that the opening of the Panama canal will effect great changes in carrying facilities and that the establish-

ment of liners on the route will lend to exporters being enabled to forward conveniently sized parcels that will find ready purchasers.

"There is already a fairly steady trade in this (Newport) port in Columbian pine timber, and a certain quantity is imported every year. At present, however, cargoes are brought by large sailing ships, and the greater length of time taken by these voyages makes the business somewhat hazardous, and so restricts the quantity imported.

"When the Panama canal is open for traffic we have every reason to anticipate that by the use of steamers and the shortened voyage, the trade will receive an impetus, the cost of the timber thereby being greatly reduced, and its use in this country consequently increased."

"We have imported British Columbia pine for some years past in full cargoes, but the demand for it is quite limited. It is doubtful if the sale will be materially increased by the opening of the Panama canal, though this of course depends somewhat on the amount of reduction in price which this route brings about.

A Cardiff Firm

"We have imported British Columbian pine for some years past in full cargoes, but the demand for it is quite limited. It is doubtful if the sale will be materially increased by the opening of the Panama canal, though this of course depends somewhat on the amount of reduction in price which this route brings about.

"It may have the effect of increasing the number of importers without increasing the total quantities sold in the long run."

Imports of Wood

"The following is a list of the imports of wood goods into the port of Bristol for the last three years:—

From—	1911. Loads.	1912. Loads.	1913 Loads.
Europe	97,651	96,564	140,921
Canada	47,609	42,424	31,284

Importance of the Filing Room

It is a true saying that to do good work we must have good tools; it is false economy to try to do without them. I have filed for several companies whose filing rooms were very poorly equipped, and, of course, they expected equal results as those who have well-equipped filing rooms. On the other hand, I have worked for companies which had up-to-date filing rooms when the mill was first built, but they are not kept so. When any part of the machinery is broken they never want to replace it; their motto is, "Patch it." Patching is alright for the time being. I have seen some good jobs done along the line of patching, which lasted for an indefinite time, but it can't be depended upon. The sure plan is to order and replace the broken part at once.

The band saw grinder, for instance, is a very important machine and must be kept right to do good work. What I mean by right is to keep all the lost motion out, keep it well oiled, see that the cam shaft and boxes are not worn, keep the finger pin ground smooth and round, and the gate and slide in good order. If not kept so the emery wheel will wear very fast. See that the emery dust does not accumulate on the clamp that holds saw to machine. This dust will wear the saws in the second quarter, and, if the pulleys on band mill are worn very much, will cause center cracks where the emery dust wears; so be sure to clean dust off before clamping the saw.

To set the machine see that cam is set so that saw starts ahead before the emery wheel starts up. This will keep the teeth grinding ahead all the time, and not back; in other words, it will help to get rid of that "hollow back" which seems to bother a great many filers. Always keep the swage in perfect order, so that the grinder will work freely and easily.

In a good many cases when the swage is not working well the filer will think it is the grinder not doing its part. Perhaps the grinder will do very well after the first swaging, and on the second grinding the emery wheel will grind hard on the front, with the exception of point, and will only barely touch this. This being the case, the swage is not rolling ahead far enough, therefore the grinder bears the blame.

In setting swage never set so that it will pull the metal to a point, but roll it to a point. When it is pulling to a point you will find that it will bite or nip it off, and leave the point very thin and brittle. Then you will have to upset or grind very heavily, and in either case metal is wasted. If swage is set so it will roll the metal to a point, then it will neither have to be upset nor ground hard, for the swage is rolled to a point where the emery wheel will hit it lightly and will not wear the steel fast nor cause fractures.

Every time I think of the saw-stretcher it reminds me of a mill I

Taking out ties for the C.P.R.—A typical scene.

filed in western Florida several years ago. It was a single band, and at the time I took the position was cutting on an average of 25,000 ft. in ten hours. This mill could cut timbers up to 60-ft. in length (all long-leaf yellow pine), and should have been cutting from 50,000 to 60,000 ft. in ten hours, as it was all export bill stuff. The saws were running in the log so badly that they had to move the base of the carriage $1\frac{1}{4}$ -in. from the saw, to keep saw from running into it.

When I arrived the general manager took me over to his office and related everything, saying he could not imagine why the saws were running in so badly. He advised me to stop the mill and investigate and fix any trouble that I found. With the determination of finding the trouble, I went into the filing room and was successful in locating it. The first machine I saw was a roll or saw-stretcher. I examined this and found that the levelling block, or slab, was actually 4-in. higher than the rolls. Now just imagine this block being as much as 1-in. or even $\frac{1}{2}$ -in. higher. I could not possibly keep a smile from my face, for I felt that the trouble had been discovered at once.

Without any further investigation, I lowered the block $\frac{1}{8}$ -in. below the rolls. While doing this the old filer came into the filing room and asked me why I was lowering the slab. My reply was: "Did you ever level your saws?" He replied in the negative, saying he always left that to the rolls; that he never levelled the saws himself.

Placing the saw on top of the bench, I began levelling it. The eyes of the old filer were as large to me as a full moon in August, when he saw the straightedge rocked on the saw. It was dished so badly that it took a half day's work to level it. Then, giving it a roll and a promise, on the other side, I ground it and put it on the mill. Honestly, I believe it would have been impossible to bring a larger smile to the sawyer's face without moving his ears. I filed this mill for some time afterwards and never came in contact with any other trouble.

I once heard a conversation between two French-Canadians. One, who was relating his experiences on the Pacific coast, said: "I was sawing in a mill out on the Pacific coast that was so large that the head filer was getting \$65 per day and the company was furnishing him with fourteen helpers. The compound engine that drove the mill was so large that it took a barrel of oil to every lubricator drop." The

Taking out ties for the C.P.R.—The crew at rest.

other, in reply to this said: "I've had several years' experience on the Pacific coast, and at one time sawed in a mill that did not consist of quite as much machinery for the big engine to pull, but the mill was seven storeys high, had a carriage on each floor, and a band saw 550-ft. long. They had a telephone system in this mill, so the filer could talk with the sawyers on each floor at any time he wished." Those were surely "some" mills.—The Woodworker, Indianapolis.

How the C.P.R. Protects Its Tie Supply

The Canadian Pacific Railway Company are very extensive owners of forest lands, and through the Forestry Branch of their Department of Natural Resources are carrying out a large amount of work with a view to conserve their natural resources. Last year the Department cruised and valued timber to the extent of 645,330,000 feet B.M., in addition to preliminary surveys over 217,300 acres of forest. The company came into possession of large tracts of forest in connection with various railway charters taken over, and have maintained an active interest in their forests owing to the necessity for finding ties for the tracks. This branch is at present engaged on a systematic forest survey, classifying the land on the present tie reserves. Experienced estimators covered, during 1913, with this object, 265,338 acres in British Columbia. 769,000 ties were delivered to the General Tie Agent at Winnipeg during the year. The contract for 1914 is for 500,000, and of these, half had been cut and skidded to the Bull River by December, while 10,000,000 feet of lumber were in the water ready for the spring drive, and 7,000,000 feet on skids.

Not the least important work of the department is the patrolling of the forests to prevent fires. An elaborate system is in force, and last year 127 fires were investigated. The railway companies now recognize the value of this work, not only as a means of preserving their own property but also the forest lands through which their lines pass.

The C. P. R. Forestry Branch also plants trees for snow breaks along the western lines, 1,450,000 trees being used in 1913, and 250 miles of track protected with timber belts.

Commercial Importance of White Pine

Canada's Most Useful Wood—Mainstay of the Timber and Lumber Trade
For Many Years—Fifth of the Series on Canadian Trees

By R. G. Lewis

Eastern White Pine

ing with over 82 per cent.

Two Canadian Species of Pine

There are in reality only two species of pine in Canada that can properly be called "white" pine. These are eastern white pine (*Pinus strobus*) and western white pine (*Pinus monticola*). The former is found throughout the Maritime Provinces and in Quebec and Ontario south of the height of land. It is also found in South-eastern Manitoba but only in scattered, small quantities. Western white pine is confined to the Province of British Columbia and is most abundant on the coast and in the Kootenay region. Out of the total cut of white pine in Canada in 1912: 911,427,000 feet, only 1.7 per cent or 15,543,000 feet were made up of the western species which comprised the total cut of white pine in British Columbia.

The wood of the white pine proper is light, soft, not strong except in relation to its weight, fairly durable and compact. It has a fine, even, straight grain, is not splintery, can be easily and rapidly seasoned, and once properly seasoned, holds its shape better than almost any other coniferous wood in America. The heartwood is reddish in colour and the sap-wood almost white.

The following are Sargent's figures for the properties of white pine (*Pinus strobus*):—

- Dry weight of wood—24 pounds per cubic foot.
- Specific gravity—0.385.
- Ash—0.1 per cent of dry weight of wood.
- Fuel value—51 per cent that of white oak.
- Breaking strength (Modulus of rupture)—8,800 pounds per square inch or 55 per cent that of long-leaf pine.
- Factor of stiffness (Modulus of elasticity)—1,208,000 pounds per square inch or 57 per cent of that of long-leaf pine.

Mature trees make a diameter of from 4 to 6 feet and reach a height of 75 to 120 feet. Individual trees have been measured that made a diameter of 7 feet and a height of 240 feet. This is probably the largest tree east of the Rockies.

Western white pine (*Pinus monticola*) has very similar properties:—

- Dry weight of wood—24.3 pounds per cubic foot.
- Ash—0.23 per cent of dry weight of wood.
- Fuel value—52 per cent that of white oak.
- Breaking strength (Modulus of rupture)—8,700 pounds per square inch or 54 per cent that of long-leaf pine.
- Factor of stiffness (Modulus of elasticity)—1,356,000 pounds per square inch or 64 per cent of that of long-leaf pine.

Western white pine is a smaller tree at maturity than the eastern species. Its average diameter is between 2½ and 3½ feet and its height from 100 to 175 feet.

The Leading Wood for Building Material

The two most valuable properties of white pine are the ease with which it can be worked and the fact that it holds its shape after seasoning. More white pine is used in building construction than any other wood in Canada and the greater part of the lumber sawn is used

for this purpose. For sash, doors and blinds it has few successful competitors except where its increased value has permitted the substitution of some cheaper wood. White pine can be used to advantage in every part of a building from the shingles to the sills. Its stiffness and lightness are added advantages in its use for framing timbers in houses and in barns. Hemlock is taking the place of white pine for framing purposes to a large extent, being a cheaper and stronger wood, although less durable, harder to work, heavier and more liable to warp and twist.

For all classes of inside and outside trim, siding, sheeting, verandah work, ceiling, moulding, cornice, panels, base board and wainscoting, white pine is the king of woods for utility. It lacks a distinct figure and cannot compete with the more attractive hardwoods for beauty of appearance under varnish. But it is much easier to work and holds its place better than any hardwood. White pine does not make the best flooring when subjected to heavy wear but in many situations is superior to harder, coarser grained wood.

Extensive Consumption in Boxes

Next to its use for building material, white pine is used in greatest quantities by manufacturers of boxes and box shooks. The wood is light in weight and easy to nail although it does not hold the nails as well as some of the box woods. Once very plentiful, the wood was used because of its cheapness and even now, when good white pine box boards are by no means cheap, the habit of use has become so strong that manufacturers find it difficult to substitute woods that are better suited for some classes of boxes. The medium and poorer grades form the greatest part of the lumber used, for this purpose. White pine boxes are used for packing all sorts of commodities, although as a rule, non-resinous woods such as spruce are preferred for packing food stuffs or commodities that might be injured by the resinous odour of the pine. For inside work on furniture white pine is valued for its lightness and permanency of shape. It is used for drawer parts, frame work and filling and sometimes for core stock under veneers. White pine is still used for the tops of tables where edged tools are used, as it does not dull the tools. For drawing boards and heavy draughting tables soft white pine or "cork" pine is the favorite material.

The Leading Wood for Patterns

One of the most exacting uses for soft white pine is in the making of patterns for castings. For this purpose the heart wood of mature trees gives the best results as it is usually softer and freer from knots, crooked grain and other defects. This soft pine has been given a number of names by its users and by many is considered to be a distinct tree from the ordinary white pine. "Cork" pine, "pumpkin" pine and even "pattern" pine are among these names. Other woods are purchased in small quantities for making patterns that are to be used repeatedly, or that are very complicated in form. Cherry and mahogany are used to a small extent but these are too expensive and difficult to work for the majority of patterns. White pine, grown in northern latitudes on good soil and allowed to reach maturity, produces a wood that is peculiarly suited for this purpose being solid without being hard, soft but not spongy, and free from defects. It cuts easily in any direction either with or across the grain, and above all, holds its shape without warping, checking, shrinking or swelling. No satisfactory substitute has ever been even suggested for this wood for this particular purpose.

The manufacturers of matches have created a steady and increasing demand for clear white pine match blocks. The scarcity of good match wood is becoming more and more apparent every year. Cheaper and less satisfactory woods are being used such as aspen, poplar and spruce but only because of the prohibitive cost of white pine. The blocks used for match making must be of clear, straight grained material. They are usually cut to a thickness equal to the length of the match stick and split or cut into sticks by automatic machinery. White pine is prized in this industry on account of its straight grain, and comparative strength, considering its weight and softness. In addition to these qualities white pine match sticks ignite easily and the glowing charcoal dies quickly after the match is extinguished.

Unexcelled for Ship Decking

White pine has always been a favorite wood with the shipbuilder and most of the Quebec pine exported to Great Britain was used in this industry. While the wood is not so durable nor so strong as some of the woods used for this purpose, it is very light in weight which is an important consideration in the building of vessels. Canadian white pine was for many years the only wood used in

quantity by British shipbuilders for decking. The decrease in its use for this purpose in late years is due only to the scarcity or rather the supposed scarcity of lumber of a suitable quality. White pine decks once well laid, kept their place, the cracks did not open in dry weather and the surface was always easily cleaned. A holystoned white pine deck always has that fresh clean appearance so desirable for high class passenger boats.

Douglas fir and spruce have largely taken the place of pine for spars and in any case Norway pine was used more often than white pine. One of the first instances of forest conservation in Canada was in the setting aside of the Norway pine for spars for the British Navy.

For all classes of what is called "straight stave" cooperage, including pails, tubs, firkins, kits and tanks white pine and cedar have always been the favorite woods in Canada. For larger water-tight containers such as cisterns, vats and silos, white pine has only lately been displaced by cedar and cypress which exceed it in durability in contact with moisture.

Miscellaneous Uses of White Pine

Bee-keepers and poultry-men consider that white pine is the best wood for bee hives, frames, brooders, coops, crates, and other accessories. Agricultural implement makers use the wood for straight box work where strength is not an essential quality. White pine water pipes were used in Canada and in the States when city and town water systems were first installed. Wooden water pipes have the advantage over metal ones in that they wear smooth inside with use instead of becoming roughened with accretions. This gives a better flow of water by reducing the friction. Old water pipes of white pine removed in building the foundation of the New St. Lawrence Market in Toronto showed very few signs of decay although they had been in the ground for at least fifty years. Wooden water pipes are still manufactured and used extensively as flumes for hydraulic work as well as water supply. They are now made mostly of cedar and Douglas fir.

White pine pump heads and logs were always in demand and are now only giving way to substitution by metal. Cypress and cedar have taken the place of white pine for greenhouse construction. Cedar and built-up veneers of other woods are now used more than this wood for trunk boxes, where lightness and strength are essentials. For piano action parts and sounding board ribs, white pine is still chosen on account of its permanency of shape. It would be difficult to mention an industry which does not use this wood directly or indirectly for some purpose and many industries demand it above all others.

Mistakes in Installing Machinery

One of the most common mistakes in installing machinery is in getting pulleys too small and then having to load down the tighteners to prevent belts from slipping, says B. J. W., in *The Woodworker*, Indianapolis. The loading down of tightener is, of course, not a mistake. Some means must be employed to prevent slipping and this is usually the first thing thought of and the cheapest way out of it for the time being.

The writer recently remodelled a mill in which the head rig (a pair of 60-in. circulars) was driven independently by a 200 h.p. engine, but was short of sufficient power. The driver on engine crankshaft was 6-ft., 20-in. face, leading onto a 36 x 20-in. pulley 31-ft. centers, with a 20-in. belt and a tightener weighing about 1,500 lbs. At the outer end of this shaft was a 36 x 20-in. pulley, driving an 18 x 20-in. on saw arbor, with a tightener riding with a load of 1,200 lbs. The top saw was driven from the bottom arbor, using 20-in. pulleys and a 12-in. belt, the tight side pulling over a 16-in. idler; the idler was on slack side, being hung in a pivoted frame and loaded down with 800 lbs. of scrap iron. The mill in this condition had been cutting about 20,000 ft. in ten hours, and had to hustle to do this much.

A new husk was provided and the pulleys were rearranged. The initial driver remained 6-ft., driving to a 54-in. pulley, then through a 72-in. to a 32-in. on saw arbor. Top saw pulleys were changed to 32-in., using same belts in all cases. The tight side of top saw belt was made to pull direct by placing both idlers on the slack side. Tighteners were adjusted so as to not exceed their commission, the engine was speeded up from 160 to 210 r.p.m., the resaw drive was overhauled accordingly and the bevel gear to edger drive was discarded and a belt over two idlers was substituted. Cutting was resumed with the same filer and sawyer and 60,000 ft. of good lumber was about the average ten-hour cut. Plenty of steam was now at hand, where before they had been "shy" a good part of the time.

Here we have three times as much work with about one-third more power, which all lies in the proper transmission. There are but few saw mills which are free from some of this drag. One of the most common places to find it is in the drive of band mills. Nearly all band mills have too small a pulley. Another place is the driving pulley of planers, which in most cases is seriously too small. A belt will do bet-

ter running at a fast speed with a light tension than it will at a slow speed with a high tension.

The subject is one that demands close attention and judgment, but does not often get it. There are many saw mills that look to me like an aggregation of machinery designed to consume power rather than to manufacture lumber. One close to where I live, which has lately been rebuilt and generally overhauled, has one of the worst cases of the malady that I have ever noticed. They can't get steam enough; the boilers foam and discharge their water through the engines; they keep spending money to prevent this in every way but the right way, and are borrowing money to meet the pay roll.

They have provided separators on the feed pipes, exhaust heads, condensers, boiler compound, etc., but there is absolutely no difference in the way the boilers throw off their water. The water has been analyzed a number of times and pronounced pure. One engineer was discharged for telling them what was the matter; another was hired at a larger salary and has been provided with all the above improvements (?) and I heard the manager remark that the man at the head of his power plant was the only man he had employed whom he thought competent. The mill has three rigs and a gang edger and cuts from 20,000 to 30,000 ft. in ten hours.

I once built a mill for a company, the manager of which was anxious to get the largest possible quantity of machinery for his money, and this is the way he went about it: Plans and drawings of the plant were made and approved; we were steering for a mill that would cut 75,000 ft. in ten hours. Schedules of the machinery and equipment were made out and makes and sizes given in all instances; material was provided and the work of constructing the mill begun. It was up to the wise and brilliant manager to purchase the machinery and equipment.

He started out by getting prices on everything as specified, then tried to see how much cheaper he could get it. He had all the second-hand men and junk dealers chasing him, and about once a day he would come and tell me how much he had saved on a certain article. I would ask him the make and condition, and he would answer that it was as good as new and same as list. Soon the stuff began to arrive. About the first things that came were the four boilers, which were set in place and inspected, and a certificate was given allowing a pressure not to exceed 60 lbs. Everything else in proportion came along and we set it up under protest, until I got tired of protesting, after which it was set up without protest and things seemed to go much smoother. Finally the mill was completed and started up with the 60 lbs. pressure of steam.

I remained there finishing up odd jobs for about two weeks, and thought I could notice an air of disappointment in the manager's manner and felt that he was blaming me for the great deficiency in the cut, for the mill would not do better than 30,000 ft. a day. When I came to settle up I asked him if he was satisfied with his mill. To my complete bewilderment he answered the question enthusiastically, saying he was more than pleased with it; that he had the best saw mill in the state and had gotten it \$10,000 cheaper than he had expected.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled, is issued by the Supervisor of Cullers' office, Quebec, under date of June 5th:—

	1912	1913	1914
	Cu. Ft.	Cu. Ft.	Cu. Ft.
Waney white pine	124,880	5,720	52,520
White pine	80	40
Red pine	1,320
Oak	1,320	560	32,240
Elm	43,080	29,480	96,960
Ash	120	840	480
Birch and maple	38,640	47,680	50,800

Rapid Advance of Swedish Pulp Industry

The wood pulp industry in Sweden is the subject of a report published by the Department of Trade and Commerce of Canada in its weekly report under date of May 26th. "As direct enquiries from Canadian pulp mills are frequently received in regard to the situation of the pulp market in Sweden," the report says, "the following translation is taken from the Norwegian official journal of recent date":—"The Swedish pulp industry is making rapid progress and plays an ever larger role in the trade balance of the country. The export from Sweden during 1913 was, of mechanical moist 580,300,000 lbs., as against 479,020,000 lbs. in 1912; of mechanical dry 129,820,000 lbs. during 1913, against 126,390,000 in 1912; of chemical dry, 1,371,900,000 lbs. during 1913, against 1,360,150,000 in 1912; of chemical moist 127,600,000 lbs. in 1913, against 114,400,000 in 1912. This indicates quite a rapid rise throughout the whole line."

Yellow Pine and the Dry Rot Problem

Important Report Prepared by an Expert on Behalf of Factory Mutual Insurance Companies—Causes and Precautions Explained

An editorial reference to a statement regarding yellow pine recently made by Mr. F. J. Hoxie, engineer and inspector for the Associated Factory Mutual Insurance Companies, Boston, Mass., was published in the Canada Lumberman of February 15th. Mr. Hoxie, after studying the effect of dry rot upon mill timbers, especially in textile and other factories where ideal conditions exist for the development of dry rot fungus on account of high temperature and extreme humidity, is reported to have said that hard pine of the old durable variety is now out of the market, and that sufficient to build a factory cannot be obtained in the sizes required, at a price competitive with other materials. This remark came in for widespread criticism in the lumber trade journals of the United States. They gave Mr. Hoxie credit for attempting to point out a scientific and businesslike method of preventing the use of unsuitable timbers in the frames of mill buildings, but they found fault with many of the facts upon which he based his statements, claiming that good long leaf timbers were still obtainable at reasonable prices, and placing the responsibility for the use of unsuitable short leaf and loblolly timbers, upon engineers and architects, who failed to obtain the right class of timbers, because they did not insist upon them. They also criticised Mr. Hoxie's conclusion that the resin percentage in these timbers was the index of their durability, claiming that the resin occurred in small and isolated ducts, the antiseptic action of which was due largely to its waterproofing quality, and therefore, when so definitely segregated, resin could not protect the rest of the wood structure in which only traces of it could be found.

Mr. Hoxie's views upon this subject have now appeared in the form of an address presented at the annual meeting of the National Association of Cotton Manufacturers, and his report makes it possible to arrive at a much more definite conclusion in regard to the very important subject which he had under discussion. So extensive has the use of Southern pine become in Canada for the construction of mill buildings, and in fact for many other classes of building in which it is used to support great strains, that the report of an expert engineer and inspector of Mr. Hoxie's standing is of unusual importance to all who have to do with the selection of timbers for purposes of construction.

Dry Rot a Recent Development in Timbers

Hard pine, Mr. Hoxie says, has been used for the floor beams for the past fifty years and has given satisfactory service in all respects until within the last five years, when dry rot has appeared with such frequency as to demand investigation. Twenty cases have been brought to the attention of the Factory Mutual Fire Insurance Companies within this period. The damage has varied from a few hundred to nearly a hundred thousand dollars. All common varieties of timber have been attacked, but yellow pine most frequently, as that is in most common use for mill frames.

The cause of this rapidly increasing destruction is unquestionably the use of poorer timber than in former years. The frame of a mill is now rarely seen, of which North Carolina, shortleaf or Cuban pine do not form a considerable proportion. The best qualities of heart wood of these varieties are probably as resistant to rot as longleaf pine, but they are less uniform and the poorer qualities are generally more difficult to detect.

In textile mills, the high artificial atmospheric humidity undoubtedly increases the tendency to rot. With 70 per cent. saturation of moisture and a temperature of 80 per cent. Fahrenheit in a weave room, a decrease in temperature of 12 degrees or more will cause precipitation of moisture. This condition is frequently found in cold weather at roofs, windows or bearing ends of beams in the brickwork.

The longleaf pine has proved more valuable for timber than the others owing to its greater strength and durability. The latter quality is probably chiefly the result of the high percentage and uniform distribution of the resin and the small percentage of sap wood, the sap wood of the longleaf pine averaging about two inches in radius of mature trees, while that of the other three varieties varies from 4 inches to 6 inches of the radius.

Good Timbers Available at Reasonable Prices

In a recent trip through the longleaf pine forests of Louisiana, Mississippi and Alabama, I found it evident that longleaf pine of suitable sizes for mill timbers can be had at reasonable prices. It remains to make specifications defining the qualities required, when a bill of timber for a cotton mill, or other important structure is sent out by the designing engineer or architects, to be sure of get-

ting timber that is strong and durable. Evidence of the inadequacy of the specifications now in common use is plain in many ways.

I found in all cases shortleaf pine growing in the same forests with longleaf and cut by the same mills, which tends to disprove the statement of a well-known authority that the place or origin of timber, as shown by the bill of lading, serves as a suitable safeguard. It is not enough that the most of a lot of timber shall resist fungus to secure a safe structure. All of it must be resistant. In no case investigated has all the timber of the mill rotted.

The need of more definite specifications for mill timbers and columns, I find, is appreciated by the lumber manufacturers who produce good timber. Many examples were given by the manufacturers where timber bought as "shortleaf" had been sold by middlemen as "longleaf," or "merchantable" sold as "prime," and the "square edge" sold as "merchantable."

The lower grade of hard pine timber called "square edge and sound" does not pretend to be longleaf pine. All varieties (longleaf, shortleaf, Cuban and loblolly) are manufactured indiscriminately into this grade. Its durability cannot be depended upon without antiseptic treatment. One of the most serious cases of rotting which has been investigated was undoubtedly due to the use of this grade of lumber in filling a specification calling for "the best quality longleaf Georgia pine."

Heart Wood Percentage the Grading Basis

The percentage of heart wood in hard pine timber is now used almost exclusively as a basis for grading, and the fineness of grain as an index of longleaf pine. Neither the one or the other is infallible. Shortleaf pine has well defined heart wood which is highly susceptible to fungus attack. It also has grain bands which are frequently finer than those of the best longleaf.

A suggestion made by Mr. Weiss, Director of the United States Forest Products Laboratory, which is excellent so far as it goes, is that all hard pine timber should be clearly branded with its grade and variety, the name and location of the saw mill responsible for the grading, thus making the manufacturer responsible for the selection of the material. This suggestion is in the right direction and should put a premium on selected material, rewarding the careful manufacturer for his painstaking. With this system in use, there will be the Calcasieu, the Wausau, the Newman, the Lutch Orange or the Kaul quality of timber rather than the present conventional "longleaf" or "shortleaf."

The grading will still be upon a vaguely defined standard. Its value will depend upon the care and good judgment used by the manufacturer in sorting the material. It will make it less easy to falsify grades and facilitate locating the responsibility for mixing poor material with good. Under present conditions the dealer who can mix the most loblolly and shortleaf with his longleaf timber, and get it accepted, has the advantage.

Clearly defined quantitative chemical and physical standards are needed as a basis for timber grades, in addition to the branding suggested, so that there will be uniformity in the grading of different manufacturers. At present, any lumber dealer or inspector can decide what is longleaf and what is shortleaf pine, as it has been made legitimate to sell other varieties as longleaf, if they are as good as longleaf, without defining its good qualities. Branding reduces the number of judges, from everybody, to the lumber manufacturers who are best qualified to know the botanical varieties which they cut. The reputation of a reliable manufacturer for producing good material should put a premium upon his product which should serve as an incentive. However, there may be unreliable manufacturers who have no reputation to lose and to whom the higher price of high grade timber would be an incentive to mix in the largest possible amount of poor material, trusting that the time necessary for it to make itself manifest would be sufficient to cover their deception. Specifications based upon the physics and chemistry of the timber can do more than anything else to raise it from the level of a gambling proposition to the higher position in structural engineering that its many superior qualities deserve.

Europe Gets Much of the Best Pine Timbers

It is a significant fact that much of the best longleaf pine timber produced in the South is being shipped to Europe. The European buyers consider quality first and are willing to pay a higher price for good timber. Too many of the Americans are chiefly guided by price. Several lumber manufacturers, producing excellent longleaf

pine timber, stated that they hardly considered it worth while to quote on true longleaf timber to the American trade, as mixed varieties sold at a lower price were practically certain to be accepted. Longleaf pine of merchantable inspection interstate rules of 1905 in sizes suitable for mill timber can be had, I am told, at about \$33 per M., delivered in New England. Prime would be about three dollars more. The best quality "German Prime" would cost from \$40 to \$50.

Undoubtedly an inspector who has had long experience with the several varieties of pine may make a very good guess as to their values. This guess is largely influenced by the apparent density and resinous qualities of the wood. General experience in the past, as well as the results of the present investigation involving a large number of mill timbers, indicate that resin and density can be taken as indices of strength and durability. The centers of shortleaf pine timbers which are more resinous than the outer portions resist the dry rot fungus much longer, as is shown in numerous examples where the centres have remained sound long after the outside has fallen to pieces with rot. Analyses of a number of specimens have shown that the percentage of resin at which dry rot stops in mill timbers is about 3 per cent. This does not mean that timber containing more than 3 per cent. of resin will not rot, but that it rots more slowly and that under average textile mill conditions the fungus will probably be killed before it has seriously weakened the beam. This suggests a possible basis of grading which can place timber on a footing similar to that of steel and concrete. Numerous measurements by the United States Forest Products Laboratory have shown that the density of yellow pine timber is an index of its strength; therefore these two factors should be important in establishing a reliable standard of grading.

Persistent Activity of Dry Rot

One of the most treacherous qualities of the dry rot fungus is that it can remain for a long time in a resting state and on being wet can develop into its vegetable form and grow rapidly through the surrounding timber. Infected sticks frequently spread the disease to other sound timber with which they are placed in contact. With susceptible timber, the most careful handling is not sufficient to guarantee immunity. The only safe procedure is to give it a reliable antiseptic treatment as soon as possible after it has been sawed.

Ventilation has been generally recommended for preventing dry rot. Dry wood which is kept dry is undoubtedly incapable of fungus infection, but ventilation does not necessarily cause drying. Timber ventilated with moist air may be made to rot faster.

Careful investigation has shown that a temperature in the neighborhood of 115 degrees Fahrenheit maintained for an hour is sufficient to kill the dry rot fungus. Its most rapid growth is in the neighborhood of 75 degrees Fahrenheit.

In conclusion Mr. Hoxie discussed the various methods of preventing the development of dry rot, by treatment of the timber before being used. Under varying conditions, coal tar compounds, creosoted compounds, chloride of zinc and corrosive sublimate have been found very effective for this purpose. Mr. Hoxie concluded his report with a summary of the whole substance, as follows:—

(a) Specifications for hard pine mill timber based on its physics and chemistry are needed, in place of the present botanical names which have little significance.

(b) Density and resin are suggested as indices of good qualities.

(c) Timber which is strong but lacking in natural resistance to fungi can be made serviceable by antiseptic treatment.

(d) Of the several antiseptic treatments which have a record from years of practical service on wood used for other purposes, kyanizing by use of corrosive sublimate appears to be best adapted to mill timber. Other newer processes with which experience is lacking give promise of usefulness.

Piling and Drying Lumber

By M. C. Berne

The problem of time is an important one in the drying of lumber. Here, as everywhere else, "time is money." A shortening of the time required to prepare lumber for the finished article is important because during this time it represents so much money standing idle, producing nothing, but gradually consuming itself in interest charges.

Time is also an important factor because the more rapidly lumber can be satisfactorily prepared, the less liable it is to receive damage. The annual loss resulting from damage to lumber on this continent alone is variously estimated to be from \$15,000,000 to \$50,000,000—a sum sufficiently large in any event to cause every man who is interested to stop and ask himself: "What proportion of this loss do I contribute?" The loss is not altogether the result of overtime in drying; it is also the result of defective piling, which either causes or allows the lumber to become crooked, as well as retards the drying process.

Some men imagine that any man who can carry a board can pile lumber; this is a mistake. Piling lumber requires brain power as well as physical power. The enormous waste mentioned indicates the necessity for more intelligent care in the handling of this great national asset. I say national asset because it is something that affects every one, more or less.

Lumber should be piled "high and dry," and in such a location that the air can circulate freely among the piles. If this is not done, the air becomes stagnant and foul, which is a favorable condition for the spread of those diseases which attack lumber and which result in decay and discoloration. If the ground is low it should be filled in. It is not sufficient to pile the lumber high above low, damp ground, because from the ground will come the cause of the trouble. There is nothing better for filling in low ground for a lumber yard than coal ashes and cinders, and very often they can be obtained much cheaper than other material.

Beyond doubt the best foundation for lumber is concrete. It is cheap, solid and durable. If well constructed and put down below the frost line it will never move. The concrete pillars should be raised above the ground sufficiently to insure a good circulation of air beneath. Air rises, and the openings between the boards will form so many flues through which the air may rise and carry off the moisture, if it be allowed to enter at the bottom. If the location is high, allow 1½-ft. at the front, giving a drop of from 8 to 10-in. In order to insure straight lumber, be sure the tops are in perfect alignment.

The usual way of piling lumber has been to pile it with one end of each board about 8 or 10-in. higher than the other. But men have been applying scientific knowledge to the piling of lumber, in an effort to save some of the enormous waste. It has now been found that in the usual way of piling lumber the cross-strips interfere with the natural circulation of air through the pile, and consequently retard the process of drying and seasoning. Not only this, but when these cross-strips are placed at intervals between the higher and lower ends of the boards, the rain that beats in washes the dust and dirt down to the cross-stick, where it remains. This takes considerable time to dry out and very often starts a rot.

When lumber is piled with one edge of the boards raised instead of the end, the air, which naturally rises, may go up the incline without being obstructed by the cross-strips, because they run the same way as the air. Another improvement has been noticed. Heretofore the tendency has been to place the boards with the edges close together, depending on the shrinking to open them up. But this is not sufficient. The very time that the lumber most needs the open space to facilitate circulation is the time it has not got it. A small space should be left between the edges of the boards when first piled.

The ideal condition for a lumber pile would be to have it covered with a roof high above the pile. This would protect the top boards from the sun and rain and yet allow free circulation of air. But this, at the present time, is not always practicable. The top boards, however, must be protected from the sun, and if we allow the air to escape or circulate through the top, it is difficult to keep out the rain. But rain coming in at the top of a lumber pile will do much less harm, if there is a free circulation of air to dry it out after the rain is over, than water driven in at the sides by a driving rain, if there is not that free circulation of air to dry it off again.

Good, clean water does not injure lumber. It is the standing, soaking and consequent mildewing in a stagnant atmosphere that discolors wood and starts decay. The covering, therefore, should be sufficient to protect from the sun, but the space between the edges of the boards should be left open, to allow the air to come through.

The cost of handling lumber is great. It is safe to say that the cost will range from 50c to \$5 per 1,000 ft. every time it is handled. This means that it does not pay to move it any oftener than is necessary. And the strange part of it is that the place where the cost is highest is usually the place where lumber is handled most frequently, because these places seem to lack system in everything. A factory which has plenty of yard room should have tracks and plenty of trucks or cars, so the lumber may, in the first instance as far as possible, be piled on these and be ready for the kiln as soon as the kiln is ready to receive it, without any further handling.

Much time and labor is wasted in storing lumber in the shed after it has been through the kiln. Tracks should run from the kiln into the shed, and the lumber run in there and left on the trucks until it is required in the factory. Lumber should not be used immediately after leaving the kiln. A short time should be allowed, in a good dry shed, for it to adjust itself to the new condition before being worked up into stock.

A great deal of damage is done to lumber by piling various lengths in one pile. When this is done the ends of the longer boards are left unprotected. The result is the unprotected ends warp, twist and check. Watch this closely, because a great deal of waste results from it.—The Wood-Worker, Indianapolis.

The Care of Saws

In the use of all swages employed in spreading the points of saw teeth, great care should be taken to see that the swaging dies are in the best condition possible, for, if they are not, they will not do the work required of them in anything like a satisfactory manner.

The teeth should also be kept in proper shape for swaging. In many instances not enough care is given to the shape of the teeth. It is a matter of great importance that the teeth be kept in proper shape to swage, as the swaging, fitting, and shape of teeth, have much to do with the successful use of a saw. If a saw has a large, round gullet, with plenty of hook in the teeth, nicely swaged and fitted, it will take far less power to drive it, make better and more lumber, and require a great deal less work to keep the plate in shape than when these conditions are not properly met.

The teeth should be slim enough to swage out easily, giving a good swage at front of tooth, but not slim enough to turn over or bend back in the cut.

If the tooth is too slim, as shown in cut "E," the swage will spread too much at the extreme points, and not extend far enough into the body of the tooth to give it the required strength. In this case the corners would be needle pointed, as in cut "F," and would be likely to break off or bend back in the cut, and the saw will not run half the usual time before it will need refitting. On the other hand, if the teeth are too stout, as in cut "C," the swage will spread too far into the body of the tooth, and not enough at the points. It will be seen that if a tooth is too stout and round on the back near the point, as in cut "C," the top die, instead of bearing a little heavier at the point, as it should, bears too heavy on the high or round part back from the point, and bears scarcely any at the extreme point. Thus, instead of the point being spread as it should, it is pulled apart, and the result is checks and splits at the point. See cut "D."

Where there is such a large amount of material in the tooth, it re-

quires double the amount of pressure to spread it. In fact, it does not spread clear through the tooth, but simply rolls the metal over at each side of the tooth, extending quite a distance down the back of the tooth, with scarcely any in front.

When it takes such a heavy pressure to spread the tooth, the dies acting on hardened steel have a tendency to crystallize and case-harden the steel. This will eventually cause checking and dropping of corners.

Swages are now made that can be conveniently adjusted to the shape and point of the tooth. After the first swaging, if care is used to not materially alter the shape of tooth, there will be no further trouble, as the swage will then fit the tooth, bearing equally on the part of the tooth being swaged. After swaging, the tooth should be faced off on the front.

We submit a number of cuts of different forms of teeth for convenience in illustrating our ideas on this subject.

Cut "A" represents section of a tooth in proper shape to swage. Cut "B" represents the same tooth after being swaged, and before being fitted. It will be seen that the tooth has been altered but very little in the process of swaging, requiring very little dressing to bring it to its original shape. Cut "C" also shows a tooth before being swaged, and cut "D" the same tooth after the operation. It can readily be seen the great amount of force it must have taken to spread this amount of hardened steel, and also the work required to bring the tooth to a good working shape. A tooth in this shape makes trouble in swaging, and is detrimental to the general working of the saw, as the teeth will cut much harder; and for this reason the plate is more apt to crack at the gullets from the severe strain on the edge.

Cut "E" represents a tooth before being swaged, and cut "F" the same tooth after swaging. In this case, as in the others, the shape of the swage is governed by the shape of the tooth before the operation. The tooth being too slim, the spreading was done at the extreme point, and the corners are therefore needle pointed and it will not stand in fast feed, or in fact in any kind of sawing.—The Simonds Guide for Millmen.

At the annual meeting of the Campbell-MacLaurin Lumber Company, Limited, Montreal, the following officers were re-elected: Messrs. Alex. MacLaurin, Montreal, president; De Witt C. Culver, Ogdensburg, vice-president; Arthur H. Campbell, Montreal, managing director; George L. Ryon, Ogdensburg, and Maurice Welsh, Toronto, directors. The accounts submitted showed that the fiscal year which closed on April 30 had been a very successful period.

Status of the Retail Business

By a Lumber Association Secretary.

That other material than lumber for building purposes has been widely exploited and extensively advertised is well known, and that many of these things are finding their way into use is equally an established fact. Also the trade is pretty generally aware that last year there was over 92,000,000 barrels of cement manufactured, much of which was used in building operations. Yet in the face of all this, it is not easy to prove that there is a decrease per capita of lumber consumption in the United States due to a decline in the retail trade.

Exact figures are not available to show positively the magnitude of the retail business of the country to-day and its comparison with a few years back, but it is a safe bet that the retail business as a whole, taking the country throughout, is larger to-day than it was ten or twenty years ago. There will likely be, of course, certain localities where the settling up of the community rapidly made a boom time and called for a much larger volume of lumber than is being consumed for building purposes in the same community to-day. But these individual communities are not the whole country, and taking the whole country over there is more lumber used to-day in modest home building than ever before, notwithstanding the coming of substitutes, and the uses of cement, brick and other structural material. There are several explanations and reasons for this. One is that the country is increasing in population, and another is that more people are building better homes, and still another is found in the subdivisions of lands into smaller farms which calls for more home building. If there is a big loss in lumber consumption, the source of that loss will be found around the car-shops where steel has also made great inroads. It is these things that are making the big inroads into lumber consumption, and incidentally one of the things that has been helping to make trouble for the lumber manufacturers is in that they have pushed milling operations and concerned themselves more with getting timber and turning it into lumber than they have with the conditions of the lumber market and the inroads made by substitutes in these lines.

It is hardly fair to make the retail trade the goat of the situation to-day and insist that the retailers are not progressive enough and not showing enough aggressive activity in the pushing of lumber exclusive of all other offerings. The retailer is doing his duty by the lumber world fairly well, and even though other material enters extensively into the stock of the retailer to-day, taking the retail trade as a whole, it could perhaps be established if figures were available that it is handling more lumber to-day than it was ten or twenty years ago. Of course, there is always a chance to boost the game and increase the volume of consumption by new lines of work and by more intensive cultivation of the field and live advertising. It is perhaps a good thing also to occasionally make the retailer think he is not doing his full duty in marketing lumber in that it may arouse him to more strenuous effort. But, and as the writer of the lame duck articles at Washington would say, there are quite a number of buts, the retail trade is doing very well, thank you, and the status of the retail business to-day is not a thing to go into fits over with generalizing, high sounding statements that the trade is asleep and is not doing anything like near the business it ought to do. Both the retail lumber business and the jobbing planing mill business is in pretty good shape taking the country over, and they are likely to continue in good shape and to keep doing a fair volume of lumber business. Substitutes here have not made the inroads some people claim they have and have generally resulted in supplementary business rather than in displacing lumber or reducing the quantity of lumber used materially.

A splendid demonstrative example of this is found in connection with cement, which is to-day a big item in the retail trade. Some would have us believe that those 92,000,000 barrels of cement replaced just that much lumber in structural work. Instead of this it is a well known fact to those who have followed the matter up closely that the use of cement has increased the consumption of lumber. There are a few cement houses, where it takes the place of lumber, but this is more than made up for by the lumber used in form work where cement is used for foundations and for big structures in which lumber has but a small place. Where the old house foundation used to consist of a few blocks set up on end or a few piers built with stone or brick, we have to-day the solid concrete and the concrete block foundations, and in the building of these more lumber is used than formerly entered into posts and sills for supporting houses. In other words, cement has added materially to the business of the retailer, yet it has not replaced lumber, but has often increased the demand for lumber to supply form material for the concrete work. This is the biggest item among the substitutes that come into the retail yard, and since it helps the retailer and doesn't hurt the lumber business, what, one may ask, is the use of all this talking of war on substitutes and the implication that it means disaster to the lumber business? So far as the retail trade is concerned, the lumber business is in good shape, and the indications are that it will stay that way.

Avoiding Claims Easier Than Settling Disputes

One of the annoying things in business is the matter of claims. The unjust ones, of course, bother us the most, but even those that are just produce more or less a feeling of annoyance, because it is an inference that we have made a mistake, and this is something we don't like to have other people know. We put up a "bluff" of cheerfully rectifying an error on our part, and paying a just claim against us but at the same time we feel it a reflection on our self confidence. We "fret and stew" over what we know is an unjust claim, according to our individual sensitiveness, and particularly those that we submit to for policy's sake, and if we kept tab on these, it would be surprising how many of them influenced us in this way. If we think a customer is honest in coming back on us with a claim for shortage; if we believe he thinks we have made an unintentional mistake, we are more apt to be charitable with him, and unless we can prove to him that the error is his, our considerations for his future good will and trade will impel us to give him the benefit of the doubt, if the loss is a minor one in amount.

As I've intimated above, it is astonishing how business men do put up with false claims for the sake of policy. The manager of the book section in one of our department stores told me of two instances of this kind that I thought were particularly aggravating. A woman came in and bought two dozen of small programme cards with little pencils attached for use at a dancing party she was giving for her daughter. In a day or two, she returned the pencils and asked that they be credited on her account. Another woman sent her little girl to purchase a book of which there were several volumes. She took the first volume home and read it, and sent it back and got the second one and returned that and so on until the seven volumes of the series had been taken, read and returned. This was done without paying for the books or their delivery, for each book was delivered to the house as it was ordered. The manager said she spoke to these two women of the propriety of their paying for what they had taken and used at their homes. They refused, however to do this, claiming that they understood at the time they could return them, which of course, was not true. But both being wealthy women and their trade during the year being considerable, it was thought best not to press the matter any further, and suffer the imposition, as the money loss was comparatively trifling.

Not Quite As Bad

Of course, we have nothing as bad as this, in the lumber business. Nevertheless, we experience some pretty unreasonable claims in the matter of returning unused stock that has been bought and sent out on a job. Dealers don't like to do it, but it has become the custom in selling a bill, to agree to take back all that is not used, and whether agreed or not, at the same prices at which it was sold. The buyer, in either case will claim it, whether it was previously agreed or understood, or not. The question of shortage, also, is quite a fruitful one for dispute even where the dealer takes pains to check it out himself. Where the yard man checks out a load he is not so absolutely sure of it as when he personally attends to it, and no more annoying thing can happen than to have the person taking it out, come in the next day, or a few days after, and want to know why you didn't send out the number of pieces that were on the bill. You look and see that the item has been checked and you are perfectly sure that your count at the time was correct. Now, in a claim of this kind, it is very unwise to get into a dispute over it. The only way is to disprove it, and in the absence of having a receipt for what went out on that particular load, a personal investigation is the only thing to do, if you want to make your word good. It is not always practicable to do this, but wherever it is possible, it will pay to do it for the moral effect, especially if it is a contractor that is making the claim. If you make one mistake like this with a contractor, he will always look for them in the future. If you are easy about the matter, the chances are of his liability to take an undue advantage of you in the future. But when he sees you determined on seeking the proof of an alleged mistake, he will be more careful in being sure of it, than he otherwise would. I learned this by many an unpleasant experience, and have spent more time in hunting out such claims, than the value of the alleged shortage several times over. No business man can afford such claims made against him for it doesn't take many of them to have a current remark being made of him that, "He will bear watching." At the same time, the dealer may be wholly innocent of deserving such talk. It is his own carelessness and disregard of the moral effect it produces, that puts a stain on his business ways of doing. You had better spend \$10 in hunting up a claim for shortage of fifty cents worth of stuff that you absolutely know was taken out, or delivered by your own team, rather than to have it get out that you will "bear watching." I was very sensitive about this, so much so that rarely any stuff went out of the yard that I didn't count before I made out a ticket for it. On busy days, I know this is hard to do, but it is on such days that most of the mistakes are made that

rise up afterward to make us a lot of trouble in settling the claims. A few minutes spent tallying what is going out, will save future worry and time spent in hunting up alleged shortages in count or measurement. Except in a very few cases I have always been able to find that the stuff went out of the yard, and in most cases, the error was in the count on the job. A number of cases I found were plain attempts to hold me up and beat me out of what was claimed.

In the earlier days, a good deal of material was stolen from a job after it had been delivered and the carpenter being careless about tallying it at the time of delivering it was not discovered until he wanted to use it. Consequently the dealer had to bear the blame, as it was the easiest to put it on him. A few of such cases, in those days, caused me to tell those who bought the stuff to be sure themselves of what they took before it went out of the yard, as I would not be responsible for it after it had left the alleys. In the first yard I had a good deal of my trade was from a distance as far as fifty and seventy-five miles. The hauling was done mostly by regular teamsters who hauled goods to the towns where there were no railroads. I required every one to personally count the pieces, and keep tally of the boards as I measured them out. Then I took a receipt for it all. Those were free and easy times, and I was told more than once, that I was too d—d particular. Be that as it may, I know, that with the understanding of my liability that I gave out and the tallying, and receipts which I held, I had no difficulty with my distant trade on the score of shortage. One instance I remember of a teamster who had it proved on him, of unloading a part of his load on his own homestead, but as it didn't come from my yard, I had no part in the settlement.

The Dealer's Responsibility Ends

In these days when lumber can be counted by the piece there is not the excuse for shortage claims that there was when every board had to be measured. The buyer then had to take the word of the dealer that he was getting the amount he was paying for, but now he can count the amount for himself. The duplicate bill that is given the buyer should show on it the number of boards as well as the amount of feet. If this is done, it can be checked off more easily by him as he takes the stuff out or when delivered as in the case with a job in town. But it requires constant care on the part of the dealer to see that his customers do their own counting before it leaves the yard whether the load be large or small. There are some customers who do this voluntarily. I like to see them do it, and consider it no reflection on my honesty, although I have seen men who acted as though they suspected me of possibly beating them if I could.

You know there are some who are so suspicious by nature, that they are hardly satisfied with their own count. We like to have men trust, and show their confidence in us. This is all very well, but too much trusting of this kind is apt to produce laxity and carelessness. We know we are more particular with the customer who exhibits a sharp lookout for his own interests. When we are sure of the fact that he is going to count after us when he gets home, we are doubly careful that it is all right before it goes out of the yard. But the way to do, as I have said, is to have him satisfied that such is the case before he leaves the yard. In other words, it is best to have your misunderstandings beforehand. Have this as a fixed rule also for your employees and hold them strictly to its observance, for, as you may have experienced, many a case of shortage has been owing to the laxity of a yard man in letting stuff go out of the yard without either he or the buyer recounting it.

A customer who is in a "boozy woozy" state when he comes into the yard is in such a dependent condition, that one has to run more or less chances on him. He may be able to make known his wants, either verbally, or by some half obscure writing on a soiled piece of paper. He is loaded up, but is too befuddled to count it, or know whether it is all right or not. Maybe he is in fairly good trim, but should he have a bottle in his pocket, there is no knowing whether he will get home without losing some of the stuff that went out. If he does, he won't know it until the next morning when he is in his right mind and goes to count it. Perhaps, however, he won't discover the loss until he goes to use it, then he will, like as not, swear it on to the lumberman.

Lost It Off the Load

I had a case of this kind once, in which a customer lost a bunch of shingles. The roads were rough, and he was too stupid to notice when it fell off the wagon. I was careful in loading him, as I always was in such cases. And therefore I was positive that he took out what he was charged with, but he came back at once with a claim for shortage that under the circumstances, I would not allow, and for some time there was that difference between us in a settlement. Luckily, however, I found out that a neighbor of his had seen the bunch along side the road and took care of it till he found the owner. From that time on, I took the care to fasten on the load, and one or

two instances I remember, I pinned the ticket on the inside of the fellow's coat so he wouldn't lose it.

Shortage in Measure

One of the most frequent causes for shortage claims is board measurement. A man has figured out for himself the number of feet required to cover a certain area of surface. He tells you what he wants and you give it to him. He comes back with the claim that you didn't give him enough. You look over your business for that day and you find you gave him a certain number of 8 or 10-inch 16-foot boards as the case might be, and it figures up to just the amount sold him. You know that both of you counted them at the time, but he lacks more or less to cover that space, which you perhaps don't know anything about. The fact is, those boards were well seasoned and he has laid them close together and the shrinkage is the cause of the claim. Now, in a case like this, where a man has done his own figuring, you should get him to tell you the space he wants to cover. Then figure it yourself and add a few feet extra, because you know, that boards don't always hold out in width and when a number are laid side by side they don't cover the space of your board measurements. I always have taken this precaution to ascertain the space to be covered and did my own figuring to obviate any shortage claim, and I date this precautionary idea from an experience I had in my second year of running a yard. At that time common boards were all widths and nothing less than 8 inches, and few of them. In fact, we would "kick" on a shipment that had over 10 per cent. of this width which customers thought was too narrow for strength, usually they were from 10 to 22 inches wide, with an average perhaps of 14 inches. When these wide boards were pretty dry, we had to be careful in measuring. We paid for a 16-inch board that the rule showed to be $15\frac{3}{4}$ inches, which in a board 10 feet long would mean one foot less than we had bought. In passing the loss on to our customers we sometimes had a dispute.

The case I speak of, was the sale of a lot of common boards to cover the shed roof of a horse and cow stable 30 feet long and 12 feet wide, which required 14-foot boards to cover it. I remember this size, because of the experience. The customer was a Frenchman, and a pretty sharp, shrewd fellow he was, too. He wanted the widest boards. He had figured the number of feet he wanted, and I gave it, for which he paid me on the spot. He was polite in his ways, and I was pleased over getting a new cash customer which were not overly plenty in those days. In a few days he came in with a stormy look on his face, and claimed in French and English that I had cheated him. It was difficult to explain to him the reason for the shortage. All he could see was that he hadn't enough. He being a new comer, I didn't want to lose him for a customer, so I gave him what he wanted, and promised to come out and measure it all over, which I did the next Sunday. I found of course, that I had measured it all right in the first place, and I stayed there until I had convinced him that I had and he was fair enough to pay me for the extra I had given him, as well as a good dinner for my pains in coming out there to make it right with him. It was a lesson I never forgot for its influence in causing me to avoid all such claims, by figuring out for myself the right amount that was needed.

Because of Incorrect Figuring

There is many a claim made for shortage on a bill that is the fault of the man who made it out, but it generally falls on the dealer and his assertion that he has given all that was on the bill doesn't always convince the mind of the buyer as he naturally thinks his carpenter knows how to make out a bill sufficient for the job. It is therefore of prime importance that the dealer should be able to have a general knowledge of what is required for the ordinary building. The bills should be figured as they come to him of course, and he should furnish the items as shown on it. But, if there is a shortage on any of them, he should be able to prove that it was not his fault. A dealer who can do this, has got the "cinch" on the carpenters who think they know how to make out a bill, but don't.

Another advantage which it gives the dealer is that he can tell when a bill is being "stuffed" on him. You know what this kind of "stuffing" means don't you? In case some of you don't, I'll tell you. In losing a bill some times, you wonder why. The reason may be that a carpenter wants your competitor to sell it, and wishing to seem friendly with you, gives you the chance to figure on it, but he gives you a larger bill than he does the other fellow who sells it of course because there is less in it than the one you figured on. This is a common trick that is played in a yard "scrap" and the dealer who is not able to detect the "stuffing" of a bill is at disadvantage if he plays a square game. Then again, if he knows what a bill should be, he can prevent the sending out a lot of surplus material for the carpenter to pick over and return what is not needed, and in such a case, what comes back is not the same grade as was sent out.

The large retail houses in the city have a claim department where everything of this character is sent for settlement. A man at the head of such a department must be especially gifted and fitted for

such an onerous job, for, while there are just claims to settle, the larger proportion of them are all the way from frivolous to downright dishonest. Yet, all claims of whatever nature are dealt with in a way that will afford the least friction with the customer, and at the same time, conserve the interests of the house. An ordinary retailer, however, has no one to whom he can pass on the complaints and claims to his trade, and therefore he has to act as his own head of this department of his business, and it requires the same exercise of tactful skill and patience as it does in a regular claim department of a larger business. The main thing is to settle a complaint so as to hold the customer, for a dissatisfied customer is an advertisement that is always working against him.

Personal Feelings Should Be Subdued

It is one of the hardest things to keep our personal feelings out of the settlement of an unjust or dishonest claim. We like to tell such a man what we think of him, and "get even" with him if we can. But all this sort of thing is taboo with the modern style of doing business. The central idea is the interests of the business. Carefulness in preventing as far as possible the cause for complaints is another principle thing to look out for and exercise on the part of ourselves and employees. Often times it is the little trivial things that have in them the seed of future trade or the loss of a good customer. No doubt some of you have had men quit trading with you and you were ignorant of the cause and entirely innocent of the knowledge of having given them any reason for the action. If you have tried to find out, like as not it was for some little thing in the way of a complaint that you had ignored as not being worth the noticing.

I remember one incident in my earlier experience where a complaint was made by a customer of two lights of glass being broken in a bunch of windows when they were opened out on his job, and he claimed that I should pay what it had cost him to replace them with new lights. I know now, that it was faulty in me to refuse, but he was so cranky and exacting about everything I put out on his bill and besides, I had sold it at such close figures, that this claim was the last straw, so to speak, and I got contrary too, and wouldn't allow the claim. I found out afterwards by the carpenter, that the breakage was made through letting the bunch fall heavily to the ground at the time of unloading, for, as the carpenter said, "I heard the glass jingle." It was many years before that man bought anything of me again and I lost his trade over a pretty small thing which I afterwards regreted. But it takes many years of training in the retail business before one learns that it is best to be less rigid about this class of claims, and give a little rather than to run the chance of losing a much greater benefit to your interests.

Because of Disputed Accounts

A goodly proportion of the claims against us come from disputed accounts. Generally they are not made until the party comes in for a final settlement and more often also, when the party has been pressed for it. The disputed item may be, is one that was got many months previous, and there is no way of proving it was got as charged, except by the entry on the books. There is a possibility of you and your yard men distinctly remembering it, but this is not often the case. It is a hard proposition to go back on one's own books even though the circumstance is not remembered distinctly, and in the absence of holding a receipt from the customer. It is a difficult matter to settle if he insists that the account is not correct. To do it, depends on whether or not the material can be seen and proven by measuring or counting it, or whether the amount in dispute is too small to risk the loss of the customer's trade and gain his future ill will and advertising you as one not to be trusted.

One has to take all these things into consideration. For my part, I am strongly inclined to hold for what my books show, because, as I have told you, I am careful in not letting stuff go out the yard without I know it is correct, and in sending a ticket with the load the buyer has his chance to verify it, by counting it himself. If he don't do this, he has no reasonable comeback on me. One way of avoiding having disputed accounts and difficulty in settling, is to give the buyer a ticket memorandum of the stuff at the time of delivery, and if it is charged to him to send him also a statement of the account the first of the month, and request a careful examination to see if it is correct. Then if there is a dispute about it, it can be more easily remedied while it is fresh in the memory.—C. H. Ketrige in the Mississippi Valley Lumberman.

The Duluth office of the H. W. Johns-Manville Company has moved to larger quarters at No. 327 W. First Street, in order to take care of its increased business. The new office is on the ground floor, with windows for the display of J-M Asbestos Roofing, Pipe Coverings, Packings, Sanitary Specialties, Auto Accessories and other products of this company's well known and varied lines.

Hook of Circular Saw Teeth

In the March issue of Simonds Guide for Millmen there was a sentence reading as follows:

"We find in our experience that the hook of a saw to be normal must be tangent to a circle whose diameter is one-half that of the saw."

Several queries as to just what was meant by this expression reached the office of the Simonds Manufacturing Company, and they

realized then that a sketch should have accompanied the article when printed. Here is the explanation. This is standard when you consider a 60-in. saw with about 90 teeth.

The circle which is half the size of the diameter would therefore be 30-in. in diameter, and the line drawn tangent to the circle, that is, merely touching the edge but not intersecting it, determines the proper amount of hook for the saw tooth. This is especially for sawing soft wood.

As the saw is worn down and gets smaller by constant usage, the amount of hook slightly increases, because then you have a smaller saw with the same number of teeth that you had in the original large saw.

Shed Building and Retail Wrinkles

I have just finished a good big shed. I am not going into details about it nor am I going to apologize for making it three storeys high, for every shed I would build on valuable ground I would build three storeys high.

Now there are just two things that I want to tell you about and the one and less important one is to make your shed good and strong in the supporting part, also nailing well the joist that extends out to support the runway or platform, our shed being a large enclosed one with driveway in the center and four foot walk on both storeys, and also nail the cross joists or supports running lengthwise of the shed well. Nail pieces of 2 x 4 on the front and back of the 4 x 6 posts to hold up the joist that support the weight of the lumber. This can be done without taking up any room whatever. You may think of it, and again you might not, so it don't cost you anything to get reminded of it.

Now what you, perhaps, don't know about and had not thought of, is how to brace your shed without losing any room. Now there are all kinds of ways to brace a shed, but our shed was built close beside another shed of like construction and we wanted to build so that if we had a pile of twenty-four feet joist in one shed they could extend over where there was a 12-foot pile in the other shed so that if there would be braces in the rear of either shed they would be in the way.

Well now, how would you go about bracing this shed to avoid losing any room. There was no trouble in bracing the shed to keep it from pitching forward or going backward, for you could brace it well at the ends and in each section from one 4 x 6 to the other upstairs and down, but to keep it from leaning one way or the other longways was the question. Well, we found a way and it did not take up any room, either. We took braces and laid them flatways in each section, crossing them and nailing them in the center.

What I mean is this. The shed had 2 x 10 joist. These joists were nailed two in front, one on each side of the 4 x 6 which stood adgewise, the same in the center and also at rear; mitering the ends of 2 x 4 to fit against the 2 x 10, they make a complete brace so that the shed can't go either way.

They take up no room and are not in the way. After you build

a shed you don't want to lose any room with braces and at the same time you must admit that a poorly braced shed is a total failure.

The Under Dog—Nit

I have always said the truth is what hurts. It doesn't make us mad to be accused of something we never did because we know that we won't have to suffer in reality for that, because if a fellow quits us when we are not to blame he will come back some day and stay and be ours for ever. It is when we feel guilty and know we are at least in part to blame that we get sore.

Well, what I was going to say, that the old "gag" of sympathizing with the "under dog" is a thing of the past. If you expect to get the lumber business on a poverty plea or because you need it, you will get left.

The people nowadays want to trade with the fellow on the top. They want to tie to the fellow who has the "dough." They don't care for the other "fellow." It isn't their fault he isn't rich.

The little fellow has to work his way up and show the buyer of lumber that he is there with the goods and the prices, too.

And, another thing, the lumberman who lets the dead beats talk him out of his lumber on credit or into selling below cost and gets broke, doesn't come in for any sympathy that he can buy anything with.

There is a whole lot of reckless figuring going on in all kinds of business and the lumberman who does not follow a system and know where he is at will, someday, find out that he has only hurt himself instead of the fellow whom he tried to run out of business.

Talking about a clear conscience, reminds me of a very pious old gentleman who came to our yard recently and bought a couple of cans of paint and had a bottle filled with turpentine and one with linseed oil and when he picked up his load he found that he had more than his hands full, so he told me to put the bottles in his pocket. Knowing his ways, I suggested that he let me wrap them up, but he refused and said, "I don't care what people think as long as my conscience is clear," and he was right, too.

And, as to keeping up appearances, I saw a good example of that in our town, or rather we might call it "going where the crowd goes." We had a bunch of Greeks come to our town a couple of years ago. They are an enterprising lot of fellows. They started into the confectionery business. Their competitors laughed at them and called them a gang of Dagos, but after they were here a month they started another store of the same kind and after they were here six months they threw out all their old fixtures and bought the best to be had. Their competitors put the price of ice cream soda down to five cents per glass and used cheap stuff. They put it down to five cents also and used the best to be had. Their competitors cut their light bill down and the Greeks had more and better light put in and when their landlord would not make needed improvements for them, they went ahead and made it themselves, and I have sold these fellows ten times as much lumber as their competitors, who own their own buildings, have bought and they never ask a price either.

They are enterprising and when we hand them a subscription list all they ask is, "How much you want?" And they say, "Put down, here is your money. We pay as we go, then we don't need to sign our name."

No one bothers them for credit and they tend to their own business and their places are popular resorts as none of them worry about anyone else's affairs but their own.

Another Greek trick I noticed at our country fair last fall was played by a bunch of Greeks who follow fairs and carnivals.

These fellows had a concession right next to my exhibit building and we struck miserable weather and in order to sell their ice cream cones they had to "spiel" rather heavy. When business was rather dull three of the four would scatter out into the crowd and when a bunch of people would be going by, the other one would make a talk for his life and the three would rush up and throw down a nickel and grab an ice cream cone and the "spieler" would holler, "Come on, see, see, how the crowd comes. Come, come quick before all are gone; nice and fresh; everybody buy them, etc.," and you know the crowd follows the crowd and they got the business, too.

So it is with the lumber business. If you get the crowd you are all right, but if you haven't the ability to get the crowd, no matter how good a stock you have, it doesn't help you out. Selling cheap doesn't get the business. It only lends a cheap twang to your business, as quality is bound to win in the end.—The Lumber Doctor in the St. Louis Lumberman.

Mr. Chas. E. Read, Jr., formerly of the Riordon Pulp & Paper Company, Limited, and Mr. J. B. White, manager of the wood department and saw mills of the same company, have entered into partnership as wholesale lumber merchants, with offices in the New Birks Building, Montreal. Mr. White, however, is not severing his connection with the Riordon Company.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 7-tf

Wanted

One or two blocks of Spruce, also Pine, must be well manufactured. Apply Box 31, Canada Lumberman, Toronto. 11-tf.

Wanted To Buy

Two million No. 1, 2 and 3 Pine Lath and one million Hemlock Lath.

M. BRENNEN & SONS,
12-15 Hamilton, Ont.

Wanted

500,000 feet Hard Maple, 1 1/4-in. to 4-in. Also 1-in. Basswood. Shipment Summer and Fall. Terms Cash. Box 32, Canada Lumberman, Toronto. 11-12

Wanted

1,000,000 ft. Spruce, 1-in., 1 1/4-in. and 2-in. If not already cut will give sawing instructions. Apply Box 30, Canada Lumberman, Toronto. 11-tf.

Shavings and Sawdust

Wanted to buy. Would prefer shavings baled and separate from the sawdust. Quote prices at your station.

M. BRENNEN & SONS,
7-12 Hamilton, Ont.

Wanted

Soft Elm, 4 1/4 log run.
Birch, 5/4 log run.
Quote lowest prices F.O.B. mill for dry or new cut.

E. M. NICHOLSON,
9-tf. Board of Trade Building, Montreal, Que.

Wanted To Buy—1000 Birch Logs

fresh, clean, straight and sound, 14-in. and up diameter at small end, 8 ft. to 16 ft. long. Delivery to commence as soon as possible. Terms: 75 per cent. cash when alongside track at railway station, balance when loaded on cars. Write P. O. Box No. 1595, Montreal, stating best price. 7-tf.

Wanted—Large Quantities

1-in. x 5-in. and up No. 1 White Pine Mill Culls.
1 1/4-in. x 5-in. and up No. 1 White Pine Mill Culls.
1 1/4-in. and 1 1/2-in. C. & B. White Pine.
Quote prices and state amount for sale. Box 29, Canada Lumberman, Toronto. 11-12

For Sale-Lumber

For Sale

Quantity of first-class cheese box veneer.

G. R. JONES,
10-12 Eldorado, Ont.

For Sale

200 M. ft. Hemlock, 1-in. and 2-in., all sizes and lengths.
70 M. ft. Hard Maple axles, dry Prime stock
50 M. ft. Soft Elm, 1-in.
25 M. ft. Soft Elm, 2-in.
25 M. ft. Soft Elm, 3-in.

Box 33, Canada Lumberman, Toronto. 11-12

Lumber For Sale

200 Pieces 1 x 15 and up 22 ft. Cypress.
375 Pieces 1 x 15 and up 24 ft. Cypress.
Clear for boat building, in stock at Montreal.

GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale

2 cars 3 x 4 to 7-in. Sound Maple Hearts.
2 cars 4 1/4 x 5 1/2 Sound Boxed Maple Hearts
1 car 2 1/2 in. Soft Elm, No. 1 C. & B.
1 car 2-in. Birch, No. 2 C. & B.
4 cars 1 1/2-in. Beech, No. 2 C. & B.
5 cars 1 1/4 in. Maple, No. 2 C. & B.
Dry stock. Immediate shipment.

Pedwell Hardwood Lumber Co.,
9-tf. 6 St. Ann's Road, Toronto, Ont.

\$15,000,000.00

We have about fifteen million dollars worth of timber lands for sale. Write us what you want. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. If you want to buy or sell write us.

THE JANESVILLE EXCHANGE,
Timber Department,
1-tf. Janesville, Wisconsin.

For Sale-Machinery

For Sale—Cheap

1 Pony Planer, McGregor & Gourlay, 24-in., in good running condition.
1 Iron Saw Table 3 ft. x 5 ft., Ballantyne Tilting Guide.
Box 28, Canada Lumberman, Toronto. 11-13

Boilers For Sale

Two Horizontal Return Tubular Boilers, 66 in. diameter by 16 ft. long. 100 lbs. working pressure at present in use. Apply to

The Steel Company of Canada, Limited,
12 Montreal, Que.

Engine For Sale

15 in. x 34 in. single cylinder Wheelock, left hand, with pulley and flywheel. In the very best condition. Can be seen in operation. Write

The Steel Company of Canada, Limited,
12 Montreal, Que.

Second Hand Machinery

150 to 175 h.p. Corliss Engine, 16-in. x 36-in., new two years ago.
75 to 100 h.p. Brown Automatic, 13-in. x 30-in., in excellent condition.
500 to 750 h.p. Buckeye; a good sawmill engine.
Boilers, 72-in. x 18-ft. and 54-in. x 14-ft.

THOMAS HOBBS,
7-tf. Mail Building, Toronto, Ont.

Engine For Sale

Single cylinder Corliss Engine, 18 in. x 42 in. Cylinder, 14 ft. flywheel, right hand. Can be seen in operation. Apply to

The Steel Company of Canada Limited,
12 Montreal, Que.

WOODWORKING MACHINERY FOR SALE: 1 MacGregor-Gourlay variable power feed saw table; 4 30-in. Ideal pedestal hand-saws; 1 54-in. Jackson-Cochrane band saw; 1 24-in. Ideal planer, matcher and moulder; 1 32-in. disk sander with boring attachment; 1 No. 51 Crescent universal wood-worker; 1 sash and door tenoner with cut-off attachment; 1 8-in. three side moulder; 1 25-gallon Advance glue heater with warming chamber and 8 2-quart pots. H. W. Petrie, Limited, Toronto. 12

Wanted-Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents.

Saw filer, band or circular, wants position. 25 years' good experience. No booze fighter. Good references. Can give satisfaction. Box 300, Canada Lumberman, 119 Board of Trade, Montreal. 9-12

BOOK-KEEPER wants position in saw mill. Worked in mill for five years previous to taking business course. Can scale and cull lumber. Box 40, Canada Lumberman, Toronto. 12

Situation wanted by married man, thirty years old, as Accountant, Chief Clerk or Secretary-Treasurer in a Wholesale Lumber Firm. Ten years' experience. Best of recommendations. Apply to Accountant, P. O. Box 69, Three Rivers, Que. 12-18

A thoroughly practical lumberman wishes to connect with reliable firm either as salesman or buyer. Ten years as partner in well-known Ontario lumber firm—six years' experience selling on road. Familiar with every angle of lumber business. Would consider salary or commission proposition. Best of references. Full particulars from Box 37, Canada Lumberman, Toronto. 12-1

Wanted-Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—A young man with experience as salesman for sash and door factory. Apply to Box 38, Canada Lumberman, Toronto. 12-15

YARD FOREMAN wanted by medium sized factory in Western Ontario. Must be qualified to inspect hardwood lumber, and able to handle men unloading and piling. Apply, stating qualifications, to Box 36, Canada Lumberman, Toronto. 12-13

WANTED—Salesman calling on the lumber trade and contractors in the Eastern Provinces, to handle Dr. J. M. Stewart's Veterinary Remedies as side line.

Palmer Medical Company, Ltd.,
10-tf. Windsor, Ont.

Business Chances

Business Opportunity

For Sale—Woodworking shop fitted especially for general work. New and up-to-date machinery. First class dry kiln. Blower system. Railway siding. Situated in a live and thriving Ontario town. Splendid local and shipping trade. This is an exceptional opportunity to acquire a good business with a trade already established.

Write J. A. C., Canada Lumberman, Toronto. 10-12

For Sale

500 square miles Crown Lands, St. Lawrence River. Front limit. All improvements. 1,500,000,000 feet Spruce, Pine, etc. If interested write Box 35, Canada Lumberman, Toronto. 12

For Sale

Complete sawmill outfit. Machinery practically new. Capacity 20 M. Two boilers 60 and 40 h.p., with cold blast grates, endless log chain, 8-in. steam feed; 3 block carriage with boss dogs; friction canter and sweep; 3 saw edger; 2 saw trimmers and a full complement of saws and belting. Also Long Mfg. Co. lath mill in first class condition will be sold with sawmill or separately. Mill near White Hall, Ont. Apply to Box 41, Jordan Harbor, Ont. 11-14

Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest. If your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. 11

For Sale

Rare bargain. Band mill located in best lumber and log center on Puget Sound. Rail and cargo shipping facilities. Excellent log pond. Ten and a half acres of land. Price one-fourth of appraised valuation. Must sell quick. Box 765, Canada Lumberman, Toronto, Ont. 8-tf.

For Sale

The best timber berth in Alberta, containing approximately one hundred million feet, four-fifths of which is splendid spruce. A railroad will pass within one mile of the limit this summer. The situation makes it an exceedingly easy limit to operate. Price \$2.00 per M., easy terms. On account of its close proximity to the prairie markets and easy logging, this is cheaper than B. C. timber for nothing. For further information apply to Box 25, Canada Lumberman, Toronto. 11-14

Timber Sale

Tenders will be received by the undersigned up to noon of the 8th day of July, 1914, for the right to cut the Red and White Pine timber on Berths 1 B, 1 C, and 1 D, in the Missisaga Forest Reserve tributary to the north shore of Lake Huron, each Berth containing an area of 36 square miles, more or less.

For maps and conditions of sale apply to the undersigned or the Crown Timber Agents at Thessalon, Sault Ste. Marie, Webbwood and Sudbury.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, April 18th, 1914.

N.B.—No unauthorized publication of this notice will be paid for. 9-13

Timber Sale

Tenders will be received by the undersigned up to noon of the 15th day of July, 1914, for the right to cut the Red and White Pine timber on berths 1, 2 and 3, Township of Blyth, in the District of Nipissing.

For maps and conditions of sale apply to the undersigned, or the Crown Timber Agents at Sudbury and North Bay.

W. H. HEARST,
Minister of Lands, Forests and Mines.
Toronto, May 4th, 1914.

N.B. No unauthorized publication of this notice will be paid for. 10-13

For Sale

Timber limit consisting of 10,000,000 feet of Pine, Spruce, Hemlock and Hardwood, tributary to Lake Nipissing. Also sawmill and logging outfit, boom timber and chains. Good reason for selling. For particulars address Box 846, Canada Lumberman, Toronto. 19-t.f.

Fine Timber Tracts

We have a number of timber tracts for sale in most all states at low prices and reasonable terms. Have few bargain tracts that are offered for quick sale. Write us what you want, we have it.

THE JANESVILLE EXCHANGE, Timber Dept., Janesville, Wis. Dealers in timber lands, lumber yards, mill machinery, mills for sale, arranging loans, selling and exchanging cut-over lands, and a general real-estate business. 1-t.f.

**Sale of Pine Timber on Metagami Indian Reserve**

Tenders will be received by the undersigned up to and including the 6th day of July next for the right to cut the Red, White and Jack Pine timber over eight inches in diameter on the Metagami Indian Reserve, situate on the Metagami River in the District of Sudbury. For particulars, descriptions, conditions, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.

Department of Lands, Forests and Mines,
Toronto, May 2nd, 1914.

No unauthorized publication of this notice will be paid for. 10-13

**Tenders for Allan Water River Wood Limit**

Tenders will be received by the undersigned up to and including Wednesday, the 15th of July next for the right to cut ties from Spruce, Balsam, Banksian or Jack Pine, Poplar and Whitewood trees seven inches and upwards in diameter two feet from the ground sufficient to supply a tie preserving plant for a period of twenty-one years from unoccupied, unsold and unlocated lands of the Crown tributary to what is known as the Allan Water River, tributary to the Grand Trunk Pacific Railway in the District of Thunder Bay.

Tenderers shall state the amount they are prepared to pay as bonus in addition to the Crown dues of \$2 per thousand feet board measure for anything not manufactured into ties, and for ties at the rate of 5c each, or such other rates as may from time to time be fixed by the Lieutenant-Governor in Council.

Such tenderers shall be required to erect within the limits of the territory covered by the right to cut ties, or at some other place approved by the Lieutenant-Governor in Council a tie preserving plant.

Parties making tender will be required to deposit with their tender a marked cheque payable to the Honourable the Treasurer of the Province of Ontario for \$25,000, to remain on deposit as security for the carrying out of the conditions of their tender.

The highest or any tender not necessarily accepted.

For particulars as to description of territory, capital to be invested, etc., apply to the undersigned.

W. H. HEARST,

Minister of Lands, Forests and Mines.

Toronto, Ont., April 27th, 1914. 10-13

Do You Want to Buy or Sell?

If you wish to purchase or dispose of a particular stock of lumber or logs, a mill property or timber limit, or some second-hand machinery, the CANADA LUMBERMAN AND WOODWORKER will bring quick returns. Use our "Wanted and For Sale Department."

Miscellaneous**Saw Mill Machinery For Sale**

Sawmill near Sellwood, Ontario, daily capacity 60,000 feet. All machinery including:—Log Ladder, Bullwheel, Steam Kicker, Log Loader, Stationary Steam Nigger, 42-in. Steel Carriage, 10-in. Steam Feed, 8 ft. Double Cutting Bandmill, Cast Iron Lumber Table, 5-Saw Slab Slasher, 48-in. Big Champion Edger, Trimmer, Transfers to Edger and Trimmer Tables, Sorting Tables, etc. Also, Independent Lathmill, Filing Room Outfit and Power Plant complete. This machinery is of the latest design, practically new and in excellent condition. Offers will be accepted for all or any part of this machinery, where it stands or F.O.B. cars Sellwood.

The Waterous Engine Works Company,
22-t.f. Brantford, Canada.

A Plentiful Supply of Cars

The greatest surplus of freight cars shown by any report since January 6, 1909, was on May 15, 1914, when the total surplus was 239,406 cars, an increase of about 9,000 cars over the figures of May 1. This is according to the semi-monthly report of the committee on relations between railroads of the American Railway Association, issued May 22. Evidently the railroad situation has been under heavy tension and it is doubtless awaiting a favorable decision from the Interstate Commerce Commission before business can be expected to revive.

It is interesting to note that the surplus of 239,406 cars on May 15 was made up of 82,890 idle box cars, 8,611 idle flat cars, 99,664 idle coal, gondola and hopper cars and 48,241 idle cars of miscellaneous types.

Another interesting feature in connection with the report is that the greatest surplus shown in any district of the country is in Group 3, comprising Ohio, Indiana, Michigan and western Pennsylvania, where the surplus is 66,450 cars, an increase of nearly 10,000 in the surplus in that district during the previous fortnight. Of this surplus 50,029 cars are coal cars alone.

The Sapsucker's Bill

The sapsucker is a pretty small bird, but he is very active along certain lines. It is claimed that his bill is one of the most expensive articles of its size in this country. He is fond of exercising on the hickory tree by picking a few thousand holes weekly through the bark during spring and early summer when the sweet sap is flowing. He goes from hole to hole after he has pecked them, and sucks the sap that accumulates. The holes are about as large as would be made by a small nail. In after years "bird-pecked hickory" is the result. The wood is discolored in the immediate vicinity of the holes and every year many thousand feet of choice hickory is degraded or rejected on account of this damage. The sap

obtained from that source is pretty rich diet for the little yellow hammer that does most of the picking. For the sake of a May morning meal of the sweet juice he spoils enough wood to make a buggy wheel. There is no remedy, as far as known. It is useless to try to catch, kill, scare, or intimidate the sapsucker, and make him quit. He can dodge round a hickory trunk faster than anybody can follow him, and he pecks as he goes. Apparently, he does no good to offset his evil; for he catches no bark bugs or wood beetles, destroys no caterpillars, eats no aphids or cynips, or in any way wars on the enemies of hickory during the period when the sap is obtainable. His bill strikes with the rapidity of a riveting machine from five in the morning until the whippoorwill calls him off at twilight.

Working Freshly-ripped Lumber

One of the reasons given for the giving way sometimes of glue joints in lumber glued up to make width is that the lumber is used too soon after edging or ripping. It is argued that after lumber is cross-cut and ripped up by the stock sawyer it should be allowed to stand for a day or two before working on the machines, and especially before glue-jointing. This argument is based on the idea that cutting the stock up into smaller dimensions perhaps releases some of the internal strain of the lumber and permits it to set up others, and that it should be given a little time to adjust itself.

This is perhaps good argument except where it involves the use of smaller pieces of lumber that may be prevented from warping and twisting by gluing together. Where one is gluing up narrow strips into door stock, for example, the better plan is to work them up soon after they are ripped, because when once glued up into a mass the internal strain of each piece is counteracted and overcome. It is well enough, however, to remember that in ripping out solid stock for door

stiles or other work it is a good idea to rip it out and let it stand for a few days before using, that it may adjust itself to the new conditions as to strains, etc.

R. O. SWEEZEY

164 St. James Street,
MONTREAL

Cleans a building of Rats and Mice in short time, keeps it cleaned, for it is always ready for use. Made of galvanized iron, can't get out of order, lasts for years. Large number can be caught daily. Go to Catcher mornings, remove device inside, which only takes few seconds, take out dead rats and mice, replace device, it is ready for another catch. Small piece cheese is used, doing away with poisons. Catcher is 18 inches high, 10 inches diameter. When rats pass device they die, no marks left on them. Catcher is always clean. One of these Catchers set in a livery stable in Scranton, Pa., caught over 100 rats in a month. One sent prepaid to any place in Canada or United States upon receipt of \$3. Catcher, 8 in. high, for mice only, prepaid \$1. On account of shipping charges being prepaid, remittance is requested with order.

Review of Current Trade Conditions

Ontario

The trade in lumber in Ontario to-day is probably in a more curious position than it has been for a long time past. One can find firms of retailers, wholesalers and manufacturers, who report that they have all the business they can handle and one can also find firms which report that the bottom has fallen out of trade. Those who report plenty of business however, are very scarce. When one seeks for information upon trade details he cannot get it, as no one seems to have it. The discussion invariably turns upon crops and railroads and how long the quietness will last. In spite of the dullness, there is quite a good volume of business in progress, and lumbermen, on account of not having overproduced, in Ontario, are not feeling the strain so badly as some others. Many reports have now been received regarding driving conditions and it looks as though the quantity of logs left in the woods this year will be much larger than usual. In the Ottawa Valley some operators have been obliged to abandon large quantities of logs until next season. In northern Ontario, most of the logs have come out, but the cost has been much greater.

A little improvement is reported in the trade at Ottawa, particularly in the export business. Prices however, remain unchanged with the volume of business light. Driving conditions have been far from satisfactory in many cases in the Ottawa Valley and reports received by the Canada Lumberman indicate important reductions in the output of some of the larger mills. One of the largest manufacturing companies in Ottawa is even reported to be considering the advisability of closing down its plant temporarily, partly on account of the poor market conditions and partly on account of the large quantity of logs which it has not been able to drive from the woods to the mill.

Eastern Canada

A little improvement is reported from St. John. House building operations have increased considerably during the past fortnight and are using up extensive quantities of spruce. Prices generally are unchanged, but manufacturers are showing no inclination to encourage weakness in the market. Those who have American stock will probably hold it until later on. Stocks of English deals are light and business in the English market is only fair. No deals are being offered at St. John as all stocks have been sold ahead. It is likely however, that present prices would be about one dollar a thousand less than those of early spring. Lath are steady at \$2.90 to \$3 on the wharves at St. John and stocks are light. Shingles are slow and about 25c per thousand lower than a year ago. Cedar logs are scarce at St. John and may have a tendency to steady the market. Most of the drives at the head of the St. John are in safe waters. The Kilburn drive is not expected to come out and this will reduce the amount rafted at Fredericton by seven or eight million feet, leaving the total about 45 or 47 million feet. At the recent "no mark" sale, spruce deal logs brought about \$15.75, and spruce battens about two-thirds of this price. Cedar logs sold at \$12, pine at \$11 and hemlock at \$19.

The demand for eastern spruce at Boston did not attain the volume which was expected during the spring season and the price in connection with most of the transactions for dimension stock is about \$24. A few mills are asking \$24.50. Some reports are to the effect that the base price of eastern spruce may go lower. Random is selling at unchanged prices, the quotations are not quite so firm. There is some business now in 2 x 4 at \$22, and \$22.50 is the top price. For 2 x 3, the price is \$21 and \$21.50. Other prices are as follows:—2 x 5, \$20 to \$21; 2 x 6 and 2 x 7, \$20.50 to \$21; 2 x 8, \$22.50 to \$23; 2 x 10, \$24 to \$24.50; 2 x 12, \$24.50 to \$25. At New York the price of eastern spruce continues steady, but the yards are not buying much in advance of their requirements, as the building demand is dull. Wholesalers are not undertaking any extensive contracts, as they expect to see a much stronger price situation some time in the near future. The demand for lath at Boston is falling behind the supply and prices are a bit uncertain. Recent sales for 1½-in. at \$4 have been reported and some makers of good lath have been securing \$4.25 from particular customers. The going price to-day is probably \$4.15, with a tendency towards accepting less. Most of the sales of 1½-in. are at \$3.70 with a little business at \$3.75 and \$3.80. British Columbia cedars are not so strong as they were recently. Excellent British Columbia extras are offered at \$3.55. Washington shingles are quoted at \$3.25 to \$3.65.

United States

The lumber trade in the United States is still limited in extent and responds but little to any reports of good crops or other business improvements which appear from time to time. It is now rather gener-

ally believed that there will be no important improvement in trade until after the summer months. Already there are signs of the trade settling down to a summer basis. Since last fall there has been no really normal trade in existence and for this reason the actual settling down to a summer basis consists rather in continuing at current prices with a slightly less active demand. Large industrial concerns, and the railroads, are keeping out of the market for supplies in excess of their current requirements. A great deal of attention is being paid by the lumber trade to the probable outcome of the growing crops. The present outlook is very promising and it looks as though, when the crops are ready for movement, the railroads will be badly in need of rolling stock. They have not been keeping up their equipment, and a car shortage can scarcely be avoided. For this reason it is generally believed that retailers would be well advised to make their purchases for the late summer and fall trade, at present, when prices for lumber of all kinds are probably as low as they will ever be. Prices are expected to continue along the present basis until a more pronounced demand develops.

Northern pine stocks in eastern markets are well assorted. Hemlock is unchanged. The demand is not so extensive as it was a year ago. Dry stocks are not any too plentiful and manufacturers expect the building demand to take care of everything. The building demand at Buffalo is considerably better. Stocks at Pennsylvania mills are scarce and many of the manufacturers are refusing to meet present low prices. The hardwood trade is still of a hand-to-mouth character, but manufacturers are holding up prices well. It is expected that business will be better a little later in the year. Dry birch and maple are scarce. Prices are firm and those who own any quantity of dry stock are satisfied with conditions. Reports from the east state that stocks of eastern spruce are gradually accumulating at mill points. The market lacks snap, as a result of the poor weather conditions which prevailed during the spring and reduced the volume of building operations. Prices continue fairly firm.

Great Britain

Little or no change is reported in lumber trade conditions at London. The volume of business is fair. The deliveries at London docks for the week ending May 23rd amounted to 4,983 standards as compared with 5,979 standards during the corresponding week of 1913. At Churchill and Sim's recent auction sale second Montreal spruce 3 x 9 brought £12. Third Quebec sold at £11 10s., fourth at £10 10s. and fifth at £9 10s. Second Montreal spruce 3 x 7 brought £9 15s. A temporary lull in trade is in progress in Liverpool on account of the holiday season. Timber arrivals have been only moderate. Pine shipments are now reaching Liverpool steadily from eastern Canada. Freights naturally have a great deal to do with current wholesale timber values. North American freights show little change and 36s. 3d. has been taken for deals from Miramichi to west coast of Great Britain and the east coast of Ireland for June loading. Spruce deals are being offered freely at Manchester and the arrivals onhand and expected include many useful and handy parcels for June and July shipments. There is a good deal of uncertainty as to the probable course of prices. The building and many other industries are busy and there are prospects of a good summer.

The timber trade at Glasgow continues quiet and of moderate dimensions. Most of the demand comes from the shipping yards, but even from this direction the demand is less than usual. Consignments of Quebec goods have consisted chiefly of birch logs, which have met with ready sale at firm prices on "ex quay" terms. Other arrivals from Quebec and Montreal have consisted largely of contract deliveries. The only sales of pine reported are a few stacks of 11 x 3-in. third and some sidings. Spruce transactions are also very few. Values are only maintained with some difficulty.

At the meeting of the Royal Society held in Montreal, Dr. C. Gordon Hewitt, Dominion Entomologist, read a paper describing the enormous damage to timber by insects. More was destroyed in this manner, he stated, than by fire. The destructive action of insects is not so easily appreciated on account of the insidiousness of their work, while the damage done by forest fires is realized because it is so apparent. Dr. Hewitt said that a loss in the forests of the United States of over \$60,000,000 annually was due to insects. He showed how insect-injured timber is more readily consumed by fire, while that scorched by fire is most likely to be killed outright by the subsequent attacks of insects. No system of fire protection, therefore, he continued, would be effectual unless insect control were included.

Market Correspondence

**SPECIAL REPORTS
ON CONDITIONS AT
HOME AND ABROAD**

Ottawa Market Still Quiet

Ottawa, June 8th (Special to the Canada Lumberman): Though trade has shown some slight improvement since the last writing, it is still far from being as satisfactory as manufacturers and dealers would like. The slight improvement noted recently has been general, including export. Prices remain unaltered with the exception of mill cull shorts, 1-in. by 4-in., and up 6-ft. to 11-ft., which have advanced from \$16.50 and \$17 to \$17 and \$18.

Unless some very heavy rains come soon, operations along the streams tributary to the Ottawa River are likely to be stopped. The unusually dry weather of the past six weeks has caused a serious scarcity of water. Gilmour and Hughson's mills up the Gatineau will close down shortly if the dry period continues, which will mean throwing about 150 men out of work. Mr. Grant Davidson, manager of the Estate James Davidson says the firm hoped to cut between 12 and 15 millions feet of lumber this year at their mills at Davidson, Qué., on the Coulonge River, but it looks now as if 175 men at the mills will have to be laid off soon and the plants closed down owing to lack of water. Firms operating on the Ottawa are not likely to be inconvenienced. The outlook is that this year's cut will be considerably smaller than last year.

Fires Cause Much Damage

Recent rains prevented the bush fires, which were raging in several parts of the Ottawa Valley from doing very serious damage. One of the heaviest losers by the fires was the Colonial Lumber Company, of Pembroke. Fire got into a valuable pine limit they owned in the Kippewa district and did several thousand dollars' worth of damage. Last week a fire started from some unknown cause, completely destroyed the lumber plant of R. T. Ritchie, Limited, Aylmer, and threw 150 out of employment. The loss is estimated at \$75,000 against which there was \$50,000 insurance. The volunteer fire brigade made a determined effort to prevent the fire from spreading. It started in a shingle mill, but the flames spread quickly to the body of the plant and it, with all the machinery and a big lumber cut, was soon destroyed. Sparks from fireworks, are said to have been the cause of the fire which wiped out some big piles of lumber and useful buildings at the yards of Barret Brothers, Catherine street, Ottawa. The loss was \$20,000 covered by insurance.

An order for five portable houses, built of three-ply seven-eighth white pine, has been given by the Dominion Government to the Estate James Davidson. The houses are to be used by the Royal North West Mounted Police at their Hudson Bay Station. A former order, placed last fall, was shipped, but had to be thrown overboard while the vessel in which they were being shipped was in danger during a storm. The value of the five portable houses is \$4,000.

Lumbermen generally are opposing the clause in the amended Railway Act, now before the government for consideration, which aims to put inland water carriers under the control of the Railway Commission, with respect to rates. Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, was present at the last meeting of the joint committee of the Commons and the Senate which is handling the bill, but was not given an opportunity to air his objections to the clause in question. The act, however, as amended will not be passed this session of Parliament, but will be introduced early next session. Big shippers of lumber say, if the inland carriers are placed under the jurisdiction of the Railway Commission, they will be deprived of making contracts that will give them a special rate.

Pembroke Company to Get Amount it Claimed

The claim of \$122,000 made by the Pembroke Lumber Company, against the Militia Department, for compensation for the expropriation of a large tract of land adjoining the Petawawa military training camp, will be paid by the government. When the supplementary estimates came before the House last Saturday considerable criticism was made against the payment of the claim by members of the opposition, who claimed the amount was too large. Col. Hon. Sam Hughes, Minister of Militia, informed his critics that the price had been deemed reasonable by an independent board of arbitrators.

A verdict against the Vancouver Lumber Company was given last week by Mr. Justice Cassells, in the Exchequer Court, in the case of the King vs. the company. The suit, which has been before the courts for sometime, was over Deadman's Island, near Vancouver. The company claimed the property under a deed executed by Sir

Frederick Borden, former Minister of Militia, in 1899. Judge Cassells ruled that Sir Frederick issued the deed without proper authority.

In declaring himself out and out in favor of free trade in the Senate the other day, Senator Edwards stated that he derived no benefit from a protective tariff.

"How about cement duties?" queried Senator Murphy.

"I do not derive a dollar from cement" replied Senator Edwards. I am a lumber manufacturer. I make my living from lumber and a very poor living too, at the present time when we are selling some kinds of dressed lumber in Toronto for \$21 per 1,000 feet while it costs us that much to put our logs on the ice." Senator Edwards urged that as the United States is ignoring protective tariffs Canada should follow suit.

Among the survivors from the recent wreck of the Empress of Ireland was Mr. J. H. Black, accountant for J. R. Booth, who with his wife was making a trip to England and France. Another survivor was Mr. Edward Seybold, of Ottawa, a relative of Mr. Booth.

St. John Market Shows Slight Improvement

St. John, N.B., June 5th (Special to the Canada Lumberman): Locally, there is some change for the better in the lumber market. House building operations have enlarged very much during the past two weeks and calls for order spruce for these buildings are coming along fast. Of course, there is no boom in building, but the increase is felt to some extent on account of the slackness during the entire spring, there being practically no business to be had. Prices remain unchanged, from last reports, and are bringing no higher returns than last season. If anything the returns are somewhat less, largely due to the weakness of both English and American markets. Very few enquiries are coming forward from the American market for spruce, and any persons who are looking for stock expect to buy at bargain prices. Very few of the mills at St. John are open to do business under these conditions and if they have any American stock will hold until later. Only two mills, viz., Stetson Cutler & Company are sawing for the American market, the balance sawing English deals. Messrs. Stetson Cutler & Company have about six vessels loading here for the United States with laths and long lumber, much of which has been placed ahead on order.

No large stocks of English deals are on hand here, as the shippers have been each loading a steamer cargo, mostly with outside deals, but some taken from the city mills, these mills being late in starting. No great stocks have been sawn ahead. Business in the English market is only fair, and it is said that Baltic stocks are being sold at a reduction. This will probably reflect upon spruce from this side, but it is to be hoped that business conditions in England will be so restored as to bring confidence to the buyers of spruce. No deals are being offered here as all stocks have been sold ahead, but probably any person having a cut to offer would have to sell at at least a dollar per M. less than early spring prices.

Laths are holding fairly steadily at from \$2.90 to \$3.00 per M. on wharves here, with no heavy stocks on hand. A new law has been passed in New York State whereby the manufacturer, wholesaler or retailer is supposed to stencil each bundle of laths marking the number of pieces in the bundle. This, the manufacturers here have not yet started to do, and if they should be called upon to do so it will cause no end of trouble. The manufacturer would be unable to count each bundle himself. Therefore he would be at the mercy of his help, who are, in many cases not responsible, and if he were called upon to take oath to so many laths to bundle he could not conscientiously do so. It is to be hoped that some solution may be had to this difficulty before the new law comes generally into effect.

Shingles are selling hard, and prices are off to about 25c per M. less than last year with buyers hard to find. The stock of cedar logs at St. John will not keep the mills which saw shingles at work over half the season. This probably is a good thing as it may have some tendency to be a steadying influence on the market.

All the drives on the head of the St. John, with the exception of John Kilburn for Murray & Gregory, are in safe waters. Mr. Kilburn it is felt cannot get his drive to booms this season, being far from the main St. John and still in the brooks, and once a brook drive is abandoned on the upper St. John it is hardly possible to get men back upon it soon enough should rain come to do any driving. Probably between 7 and 8 million feet of logs will be left. This will shorten the amount for rafting at Fredericton booms down to about 45 to 47 million instead of 54 million which was the first calculation. The drive in the

Exercise

Exercise your muscles for your physical welfare and Exercise your judgment for your business welfare.

You can exercise no better judgment in the selection of your requirements for Dressed Spruce than to use Fenderson's, the "Quality Stock."

This stock is the standard by which Dressed Spruce values are judged.

We have never aimed to make the lowest prices—but we always do give the greatest value for every dollar. It's like your clothes. You can buy them for half what you are paying, not as good, of course. It's the same question of value.

Dry stock—prompt shipment—smoothest dressing—best grades.

Jacquet River, N. B.	

**WE CARRY THE LARGEST AND BEST ASSORTMENT
OF DRY SPRUCE IN CANADA**

Madawaska corporation are doing good work and have at this date a good pitch of water, although it is falling fast on account of the dry season. The St. John River Log Driving Company have brought in their first drive and returned for the second on the section between Grand Falls and Fredericton.

About all the bank logs have been delivered to St. John, prices for logs remain firm.

Fires have occurred in the forest in this section of the country but have not done any great harm as they occurred in a largely burnt over country on which the growth did not amount to much. Rain has fallen to-day and extinguished them entirely.

Rafting operations will begin at the Fredericton Boom Company's plant about June the 8th.

The "no mark" and mixed mark logs from the spring drift drive were sold during the past week and brought the following prices. Spruce deal logs \$15.75 per M. Spruce battens, 2-3 of \$15.75, sold to Murray & Gregory. Cedar, to Messrs. Stetson Cutler & Company, at \$12.00. Pine, to Chas. Miller, at \$11.00 per M. Hemlock, to Murray & Gregory, at \$10.00 per M. The "no mark" and "five hack" logs which will be rafted at Fredericton during the coming season will be sold by auction during the next two weeks.

Trade Still Slow at Montreal

Montreal, June 9th (Special to the Canada Lumberman): Trade is slow, and as far as can be seen there is little prospect of any marked revival. Some retailers state that they are doing a fair business, but taking the market generally, there is nothing to talk about. Stocks are very short. Hemlock, spruce, and low ends of pine are extremely scarce, and some descriptions of dry lath cannot be obtained.

The building permit figures are not encouraging. For the month of May they were \$2,517,148, an increase of \$43,540, while for the year to date they were \$6,578,501, a decrease of \$1,085,630. There is talk of labour trouble, and many of the carpenters have struck owing to the refusal of the contractors to increase wages from 42½c to 45c per hour and to concede an eight-hour day.

Reports from this province indicate that the continued dry weather has had a very bad effect on driving operations. A great many logs are piled up, and will not be got out this year.

Sash and door factories are doing a small business and competition is very keen.

Exports are on a larger scale, and Watson and Todd, the largest shippers in the port, are now sending pine to the other side. Shipments of this lumber and of birch, however, are still comparatively light, and the total exports this season are likely to show a considerable falling off.

A company possessing very large limits in the province reports a very active demand for spruce by United States buyers.

Mr. H. M. Williams, of the Williams Lumber Company, Ottawa, purchased at public auction, the stock of lumber, mouldings, etc., of Ouellette Beaulieu, Limited, sash and door manufacturers, Longueuil, P.Q., in liquidation. The price paid was 50c on the dollar.

The absence of rains, which has lowered the streams to a degree not known for many years, will have a very material influence on the supplies of pulpwood, and consequently on the quantity of pulp and paper manufactured. The situation is practically the same in the State of Maine, and west of there the streams are rapidly falling. These circumstances will place ground wood in a stronger position than it has been in for three years, and with ground wood higher, prices of news print are likely to rise. It is more than probable that there will be a good market for all the ground wood that Canadian mills can manufacture and put into stock before the summer is over.

Chemical pulp is steady. The competition of European pulp has been very keen since the removal of the duty in the United States, and it is understood that there have been some spot lots offered under market prices. These lots are pretty well cleaned up, and foreign pulp for 1915 is not procurable at present prices. Although current quotations will probably prevail during the summer season, all indications point to a better demand after August, and with a more active demand, higher prices will rule for this class of pulp.

Dullness Continues at New York

Chase, Talbot & Company, New York, in their lumber market letter under date of June 1st write as follows: In the Metropolitan District we have progressed (or retrograded) to that condition in the lumber trade where the question seems to be one of who needs "the order" most. Values apparently have no relation to cost of production. Unquestionably, it is a buyer's market. The volume is small but very likely would be greatly increased and at a higher range of prices if buyers could look with favor upon pending legislation at Washington. The mid-year term is close at hand and unless the trade

soon takes on new life, we shall be forced to record the obituary of 1914.

Prices current for stock delivered on dock to yard dealers are as follows:—Eastern spruce dimension average domestic schedules, \$24 to \$26. Ordinary spruce domestic random, \$23 to \$25. Provincial spruce random \$21 to \$22. West Virginia and Penn. spruce, \$3 per M. off the list. Eastern hemlock dimension, \$21 to \$23. Eastern hemlock random, \$19 to \$20. North Carolina pine roofers \$18.50 to \$19.50. Long-leaf merchantable yellow pine dimension, \$22 to \$25. Short-leaf yellow pine dimension, \$18.50 to \$20. Pacific Coast merchantable Douglas fir dimension, \$21.50 to \$23.50. Eastern spruce laths, \$4.00 to \$4.25. Pacific Coast fir laths, \$3.75 to \$4.00.

The New York State Legislature recently passed a bill to take effect to-day providing for the stenciling or tagging or all laths in bundles marketed in this State, which marking must state the exact count of pieces in each bundle and requiring that bundles average not less than 100 pieces for full bundles or 50 pieces for half bundles.

Barbados Market Report

S. P. Musson, Son & Company, Barbados, report under date of May 22nd as follows:—Lumberstuffs—White pine—There have been no arrivals during the fortnight, but there are ample stocks in dealers' yards. Spruce—no receipts, but dealers have sufficient stocks on hand for present requirements. Pitch pine—No arrivals but the market is amply supplied. Shingles—No receipts of either Extra No. 1, or Long Gaspe, but one or two cargoes of the former have been contracted for. Shooks—No arrivals. Wood hoops—receipts consist of 500 by the S.S. "Serrana," imported on dealers' account.

Efficiency in the Planing Mill Business

The man of most importance in the conduct of a planing mill business is the one who does the estimating, for on him rests the responsibility of keeping the plant in operation with profitable business.

There are mill estimators whose knowledge of costs is entirely conjectural; they have never had the experience of following lumber from the yard, through the machinery and bench department, until it landed in the shipping room, a finished product, therefore, the only thing they know about cost of production is what some one has told them.

Many times they have been told correctly and sometimes they have remembered and estimated properly, but an estimator, to be efficient, should have an elementary knowledge of the process of manufacturing the articles on which he places an arbitrary price.

Equipped with this basic information, he can analyze a frame, a sash, a column, a door, a portico or a buffet into its component parts of material, machine work and bench work; can place an intelligent valuation on each segregation and to the total can add the proportionate amount of overhead expense and the margin of profit, which good judgment and sound business policy dictates.

Taken altogether, a reliable estimator must have a working knowledge of the product he is pricing, that is, his knowledge of machinery and mechanical construction should enable him to go into the shop and superintend any department; his knowledge of costs gained from personal experience in converting raw material into the finished product should enable him to properly price any article of millwork shown on a set of building plans or described in the specifications; his knowledge of plans must be thorough, and his reading of specifications critical in order not to overlook items of importance; the quantities he takes off must be accurate, otherwise the total, if too large, would result in losing the job, and if too small, in securing it at a loss.

The estimator must also know the competitive conditions existing on the particular job he is figuring, that is, he must know the idiosyncrasies of the architect and the extent he can be swayed into modifying expensive construction, he must know the contractors who are figuring and how many of them can be depended on to give him a square deal or possibly a little the best of it, he must know which of his competitors are figuring the same job and whether they are liable to be high or low, the latter sometimes determined by the amount of work the competitor has on hand, sometimes by a similarity of religious or political opinions held by the owner and the other millman, and occasionally by the fact that the other fellow has a preference.

All these and more must the estimator know in order to maintain an efficiency of 100 per cent. in his department, and the basic facts of his knowledge can be rightly developed in one way only, and that is by starting at the beginning and working by successive stages from apprentice to estimator.

If industry, observation and efficiency are maintained in the preliminary work, they will reach their fruition by developing an estimator who is equal to any emergency that may arise.

Camp Supplies

We make a specialty of dealing in supplies for Camps and have now some particularly good values in some of the more important lines such as Currants, Raisins, Dried Peaches, Evaporated Apples, Figs, Prunes, etc.

A New Swage The Best Yet United States Patent for Sale

This new swage invented by ourselves has all the good features of other swages plus some special patent features of its own. Those practical saw men who have used this swage pronounce it "The best yet."

View 1 illustrates a swage sawn in half to show its method of working. The tooth is swaged by a series of three rollers which cannot bind. The tooth is rolled out and not drawn.

A double thread is used on the locking lever. The first thread is rapid so that a slight movement of the lever allows the swage to travel on the saw without being lifted over each tooth. The second thread is slow so that the swage may be securely locked on the saw. The point at which the rapid thread ceases and the slow thread operates is governed by an automatic spring.

We offer for sale the United States Patent. If interested write us.

Breeze, Denison & Co.

Fancy Woods and Veneers

THEIR ORIGIN, VALUE AND
USE—COMMENT AND VIEWS
ON AN IMPORTANT BRANCH
OF THE TRADE.

Walnut and Pianos

A field which is drawing quite extensively on walnut for its raw material, and in fact that field which is probably realizing its possibilities in this direction more fully than any other line, is the piano trade. In this line of manufacture there is a steadily increasing quantity of walnut being used each year, but this is more particularly true in the middle western states than in the East, the reason probably being the fact that eastern concerns are naturally more conservative in their methods and more slow to take up with any changes in styles of raw materials, says Hardwood Record. A walnut man recently made the interesting observation, and his statement is unquestionably an absolute truth, that one of the biggest reasons for the continued absence of any quantities of walnut in fixtures and piano work (the condition which the walnut men are battling to overcome), is the widespread mis-information regarding the quantity of this stock available and the price for which it can be purchased. This walnut man said that furniture and piano factories will frequently send out inquiries for walnut stocks, and instead of taking the trouble of looking up firms who make a specialty of manufacturing this line of lumber or veneers, will write to the manufacturer of other hardwoods asking for quotations in connection with quotations on their usual line of manufacture. As a consequence these concerns, who probably have not a stick of walnut on their yards, and have no means of getting it other than through walnut specialists, write back quoting on someone else's stock at prices ranging at \$5 to \$10 above what it could be purchased for direct. The consequence is that the piano and furniture men get an entirely erroneous idea of stocks available and prevailing values. They are consequently discouraged when it comes to using any of this class of material.

Accurate information as to these two points is one of the first and paramount differences in primarily and adequately broadening the market for walnut. There is, and there will be for a long time to come, sufficient walnut to fill in the reasonable demand that might be created, and it is absolutely a fact that this stock can be had at prices which conform very fully to prices for other high-class cabinet woods. It is simply up to the walnut man to give the proper publicity to his stocks and to eradicate the vast amount of mis-information which has been pretty generally in the minds of those who would be possible purchasers; and this is now being done.

In the second place it is up to the walnut man to educate the furniture and piano man to the beautiful possibilities which are dominant in walnut to be brought out by the proper finishing methods.

Repairing Fine Checks in Veneer Work

By Rudolph Kilbourne

It occasionally happens that manufacturers of veneered goods run across a veneer that has a tendency to show up in fine checks after the goods are finished, and what to do with this defective stock in order to make it salable becomes a serious question. Frequently nothing more than the faintest outline of a check is visible until the goods are being rubbed, and then, almost before sufficient rubbing has been done to remove the gloss, these faint outlines develop into bold checks.

There are two or three ways in which these defects may be repaired, and the method to be followed must depend largely on the quality of work desired. If it is a medium class of work, the goods may be sanded and one or two coats of varnish applied; but if they are high-grade and a very fine finish is required, the better way is to rub these defective parts down in the usual way. For this purpose it would be better to use oil and pumice instead of water, because if the water goes through the check in the varnish into the check in the veneer, it will swell the latter and make the breach in the varnish much greater and more difficult to repair.

Goods that are rubbed down will not require so much varnish as will goods that are sanded, because the former makes a much smoother surface. But whichever way it is done, the main thing is to be sure and put on enough varnish to remove any danger of going through to the hard, dry varnish beneath during the second rubbing. When varnish gets to a certain stage of dryness it will not unite or "knit" with varnish freshly applied; and if we rub through the last varnish put on, into the under coats, it will look as though it had been scaled off.

After the goods have been rubbed down, take great care that all oil and pumice are thoroughly cleaned off and all lint dusted off. Examine the checks carefully, to see that none of the edges are rubbed light in color. It frequently happens that, where water has been used

for rubbing, and comes in contact with the wood, the stain is drawn out, and that part would show up light if not touched up before being varnished. For touching up, use the regular stain, but be careful and remove any that may get over the edge of the check onto the surface of the varnish. If any is left on the varnish it is liable to show darker than the rest, and much more liable to give it a bronze cast.

After all these things have been attended to, apply with a fine brush to the parts to be varnished a good coat of very thin unbleached shellac. Have this cut at the rate of about 1¼ lbs. gum to a gallon of spirits. Apply with as little brushing and as rapidly as possible, to avoid leaving brush marks. The spirits in the shellac will cut into the dry, hard varnish very rapidly, and there is great danger of the brush leaving ridges if brushed too much. When this happens considerable time will be required to sand them out. When the shellac is used very thin, just brushing enough to put it on is a good plan, leaving it to flow out itself. There is not much danger of laps showing as a result of so little brushing, owing to the shellac being so thin.

Goods fixed up this way should not be allowed to become too dry before they are again rubbed out, or the same trouble will be experienced over again, and the work repeated. If there is much of this class of goods on hand it would not be advisable to do up at one time more than is likely to be required in the immediate future. I do not mean by this that varnish, as a rule, should be rubbed before it is thoroughly dry. This is a case where a little compromise is necessary. These latter coats of varnish have not removed the cause of the defects, but have merely repaired the defects themselves, and so long as the cause remains there is liable to be the same trouble if conditions are favorable for it. The duty now is to guard against these conditions by rubbing the varnish before it has lost too much of its elasticity, or become seriously affected by the expansion and contraction of the broken fiber in the veneer, which is the cause of the trouble.—Veneers.

A Cruising and Engineering Department of Lumbering

The lumber industry has gone through many changes since the early days when it consisted largely of the cutting down of trees and the manufacturing of boards, planks, etc. The pioneers of lumbering in North America would be surprised at the great variety of activities coming under the head of lumbering as it is carried on to-day. An interesting example of the wide variety of work to which the lumber industry naturally leads is accorded by the case of the L. E. Campbell Lumber Company, Detroit, Mich. This company had its origin in the latter part of 1850 when Michigan was practically a wilderness, bountifully blessed with various classes of timber. The forerunner of the present company came from the east and began cutting oak and walnut in the Lower Peninsula, shipping the product to the eastern markets. Following the lumber industry in some of its important migrations, these people moved into Northern Michigan, to operate in the virgin pine belts adjacent to the shores of Lake Huron and they established, early in the sixties, the first sawmill of Campbellville, which grew subsequently into the city of Alpena, long famous as one of the principal pine centres of the United States.

After the depletion of the large timber in the late eighties, younger members of the firm turned their attention to the south and operated among the hardwoods and other timber for which that country is famous. At the same time other members engaged in the veneer business covering a wide field and making investigations of tropical timber in Mexico and the Latin American republics. Subsequently these operations led to the cutting of mahogany logs on the west coast of Africa and the shipment of large cargoes of mahogany from the port of Axim to Liverpool and to the American markets.

All these wide spread activities led to the members of the firm securing an exceptional acquaintance with the whole lumbering industry, and with timber values in many parts of the Globe. As a natural development, it soon came about that they were called upon to investigate and report upon timber in various countries, and in some instances their services were drawn upon to take charge of lumber operations which had been mismanaged, and which, after being put on a strong basis were turned back to the original owners and successfully operated. All this work led to the cruising and estimating of timber tracts in practically all portions of the world. One investigation led to another until the services of the company were called upon in Chile and the Argentine, as well as in many sections of the far north, in Canada and in the Pacific Coast States.

The most important development in connection with the company and its work was the creation of a cruising department. This was a

natural result of the company's expansion and to-day they have gathered together a cruising department which includes some of the best talent in the United States for undertaking and carrying out the cruising of timber, map making, operation of companies and in short anything pertaining to the lumber industry.

An attractive booklet has been issued by the company which describes in detail the exact range of work done by this department. A copy of the booklet will be forwarded to anyone who is interested, and who makes enquiry of the company at 1113 Ford Building, Detroit, Mich.

Three Types of Business Management

Strenuous, Systematic and Efficient Types—Rule-of-Thumb Management a Liability, Never an Asset*

It is important for us to recognize in the very beginning of any consideration of the question of costs, that a cost system does not unfold itself as a logical consequence of starting a business with a book-keeping department. A cost department is an entirely different unit. A cost system is not based upon the pre-determined scheme of things which flow from one to another in an inevitable and logical sequence. A cost system is the reflection of a man's mind, of his manner of thought, of his education, of his sympathy, of his training and experience, of his ability to manage, to analyze, to synthesize, to co-ordinate, to harmonize, to grasp things in detail and in the large. We understand that cost keeping at its best is an efficient method of determining exactly what time, work, and material is put into the production of any marketable energy, commodity, or service.

Do not make the mistake of thinking that manufacturing is limited to things that you can weigh on scales or measure with a foot rule. The electric light company manufactures a product as well as the automobile manufacturer. The railroad company manufactures a product as well as the sugar refinery. The banker manufactures a product as well as the hat manufacturer. The department store manufactures a product, and so does the doctor, the lawyer, and the advertising manager.

The mere fact that in some of these a definite standard of measurement has not been obtained, does not preclude the idea that their work can and must be measured and its value approximated. Therefore, no man should adopt the attitude that they can't be measured. Some people think that advertising can't be measured. This is not because it can't be measured—it is because their education, their experience has not progressed far enough to give them the ability to measure it. The savage seeing the lightning in the sky would probably find it impossible to imagine that the electric fluid could ever be measured, but it is being measured. The main purpose of any cost-keeping system is to find measures for many things that can be measured by the ordinary bookkeeping processes, or by the mere senses of careful foremen, and thereby arrive at standards of usefulness and value and determine relative costs of production for guidance in forming policies.

If a cost system is a reflection of a man's mind, or of the minds of a number of men, it becomes very important to find out what kind of men they are.

There are three fundamental types of men in the world. There is the Strenuous type, the Systematic type and the Efficient type. These types fall into divisions, determined by the methods they use and all of their mental and physical equipment. All these types are reflected in cost keeping systems. The strenuous man, for instance, is the hard working type. He may be called the "sweat" type. His philosophy in life is embodied in "DO IT NOW." He is a doer worker of muscular type. We have had thousands of them in our factories as managers. They are busy—busy-ness is business with them. They are the men who get down to the office at six o'clock in the morning and work until ten o'clock at night. They never think of the factory hygiene, of lighting, of plant planning, of functionalizing, of standards, of education. Their ideal is hard work. They take literally the proposition that man must gain his livelihood by the sweat of his brow. When everybody worked that way, of course, strenuousity was the order of the day. It didn't make any difference—the world was on a sweat basis. Then the man who was the most strenuous, made the most money in feeding a hungry market. It was a brute force—physical stamina that won. One unskilled laborer was so good as any other unskilled laborer. But when skill came into competition with the man at the bench; when brains, forethought, planning and thinking came into competition with the strenuous manager, then came the demand for protection, and the outcry against competition.

The purely strenuous type can be seen in a bookkeeper who works hard, who is loyal, but who fusses and fiddles over things, but the rule-of-thumb or strenuous man is the type that believes if he lowers his cost each month or each year, he has gained highest efficiency.

He maintains that his business is different from any other business. He thinks the only thing worth taking from anybody else is to

steal a patent, or to steal a man who has shown that he can do more than anybody else.

The rule-of-thumb man says "each man is different," that "you can't teach salesmen," that this man who is doing things so successfully has an unusual faculty possessed by nobody else.

His apprentices "learn by doing" (the good and the bad things); he hasn't any school of workmen (they already know). A school for teaching salesmanship would make him laugh—and yet he is buying his cash registers, his adding machines, his insurance policies and his loose-leaf devices, if he has any, from salesmen who have been taught in schools how to sell the produce to just such a man as he.

The rule-of-thumb man never joins business organizations except to be a good fellow—he never makes a research to find out new things—he calls it "high brow theory." You can't tell the rule-of-thumb man anything, because you can't tell any man anything that he doesn't know.

The rule-of-thumb farmer plants by the almanac and reaps by the grace of God.

The rule-of-thumb mechanic has learned his good and bad methods by the side of an older mechanic, who learned his good and bad methods from another. Each loses a certain amount of efficiency in the process of learning. He doesn't study trigonometry or geometry. He doesn't care anything about such "high-brow stuff," but he is a loyal member of his organization and talks against capitalists "who don't do anything."

The rule-of-thumb employer cares nothing for co-operation. He sees nothing but competition. The only kind of organization he wants to belong to is an anti-union organization. He is an anti-laborer; he believes that you have to use the big stick, that you have to drive men instead of lead them because, "Well, you see, that's the way it always has been done, and my father did it that way."

The rule-of-thumb banker, the rule-of-thumb retailer—all of them have ingrowing businesses because their education has never gone beyond the confines of their own particular experience.

They can imitate, but they can't adapt.

They don't really think about their business—they only think about the dollars and cents.

They don't think about men, but they think about machines.

Their costs are necessarily nothing but approximations, more or less distant, of an ideal set by the men who have worked under different conditions of a more or less distant past.

In such a plant you see "DO IT NOW" signs all over the place. In such places salaries are raised by the time clock and calendar. Such a manager has no methods of measuring men's efficiencies because he doesn't know what these efficiencies are.

His ideal of a cost system is a crude method by which the piece workers can be prevented from getting more than he thinks they are worth. He says no laborer is worth more than \$2.00 a day because that's all he has ever paid, and he is perfectly satisfied if a salesman increases his business 10 per cent. a year in his territory. If his competitor lowers prices, he wonders where his competitors "steal" the raw material. "How long can he continue to lose money?" It never occurred to him that a man can beat him at his own game and make a fortune in the process.

He doesn't analyze his business and its possibilities to find out the real reason for his success or failure. He hasn't time. He is "too busy doing things."

In the hiring of people, his ideal is to "try them out—see what they can do." The try and fail method is a gospel to him. He solemnly asserts that "you can't tell what any man is able to do." That other concerns are foretelling and finding out what types of men are necessary for certain jobs, are pre-determining what men will fit the jobs and then getting the men to fit the jobs, is a joke to him.

Of course you can't tell him anything about it because he doesn't know anything about it.

He doesn't know anything about the idea because he has never seen it at work. If he did see it, he would probably dismiss it with—"The Employment Manager was better than usual," but as for finding law or principle in any course of action, he dismisses it with—"It is the man who is doing the work, and the man who is getting the results."

The rule-of-thumb manager prides himself upon "knowing his business." He never thinks of using outside counsel. If a man would suggest to this type of mind that there is a better way in which to grind a valve, his first question would be, "how many valves have you ground?" In other words, his attitude of mind is of the man looking in the mirror when he is looking for all the reason for success.

It is a type of mind of which we have had entirely too many, and which competition and the efficiency of skilled minds, applied to skilled work, is gradually forcing out of American business. These rule-of-thumb managers act as the priests of old, adopting a precedent as a sacred flame which has passed from hand to hand, from generation to generation, each keeping it inviolate, never changing it, until it be-

comes a sacred tradition before which youth, and skill and brains and power must bow in submission. The rule-of-thumb manager is always a liability and never an asset. He may be popular, he may have succeeded, he may be succeeding, but just as inevitably as the sun rises, his day is done.

Efficiency and Progression

How often we find a mechanic capable in efficiency, but handicapped in progress! How often have men in this condition pondered over their inability to get in a position where they are enabled to climb to higher rungs of the ladder in our industrial world! There are to be found in many plants instances where men have been filling the same position for years and years; have operated the same machine continuously through the best part of their working life. In all probability they have advanced a little in wages and have naturally accumulated more skill, yet they have remained on the same step of the ladder. Some have been contented to do this, while others have not, says A. S., in *The Woodworker*, Indianapolis.

Have there, in all the years they have put in there, been any vacancies wherein they might have taken a foothold on a higher step? Yes, the old foreman has quit and the firm has sent out and hired a new one. There are some plants where this is done differently and they promote one of their old men who is capable and efficient. Quite often this sending out for a new man has become necessary in order to give a general shaking up and replacing of men, with the thought that these changes mean more rapid progress to the business.

The question arises, is it wise or practical to change positions in order to progress? This question comes up from the fact that there is often found a man who seems not able to make the progress he is entitled to with the firm with which he is employed, and also because, on the other side of the argument, there are many men who flit around from job to job so frequently that they never attain any progress in their calling.

We can study both sides of this question and still not determine an answer satisfactory to all. Take the planing mills, for instance. There are undoubtedly many machine operators who are badly handicapped at times where they are employed; that is, they are held from making any progress. In some instances it may be hindrance in the limit of the work to be done, the concern small and the duties simple. In another plant it may be that there are other men ahead in the line, so that there is small chance to work up. Again, it sometimes develops that a man is not able to get recognition of his efficiency or the qualities he has developed until he quits, leaves his home city and casts his lot among strangers.

I recall a certain firm which in the past had several men to develop into such efficiency as to warrant them in changing positions. They should have been promoted by this firm, but were not, for seemingly foolish reasons. There is probably a fundamental reason for this, so let us try and see what it is.

When one starts in young and ignorant of the work in any institution, he has it to learn, beginning at the simpler duties. Quite often he will make errors, but give him time to learn all his duties and he may qualify for a position much higher than the one assigned him. Very often, and too often in fact, the foreman or manager continues to retain a mental impression of the errors and mistakes of this man, and even though he may work diligently for years in this same place after he has acquired skill and efficiency, it seems impossible for him to eliminate the impression retained of his early errors.

Suppose this man goes away to other localities and tries to obtain employment among strangers. They know absolutely nothing about the errors of his earlier days; they take him at his word as to his ability and he is given a trial. His entry is clean and he has a chance to show this ability; he is measured by the results he produces and not handicapped by the mental impressions of any one. He stays in his new place until he has acquired greater efficiency, then finds himself handicapped. His employers remember him as he was sized up on entering their service, and this impression is so stamped upon their minds that they cannot or will not see farther. So this man, desiring to progress, must again cast himself among strangers.

These conditions are ever present and around us in all the walks of life, but we do not all take notice unless our attention is attracted. Now look at the other side of the question. There are men in many institutions who have started at the lowest rung of the ladder and successfully attained the highest places, without making a change. There are men who, when mere boys, started in a planing mill as helpers and have wound up by being the owners of the mill.

The men who are enabled to climb to the top of the ladder in the one institution present a shining example in comparison to those who flit from one position to another. We find some men who have traits about them that enable them to attain distinction almost anywhere they go. Again, there are some who attain distinction in certain plants

because those in charge take pains to bring out their best qualities. Look at the many things which play important parts in the mechanic's development; quite often it is hard to pick out which part, among them all, deserves the credit for his progress. Take a man who has worked steadily for a long number of years with a firm and no recognition of his ability is given by his employers. He more than likely becomes discouraged and begins to look for new fields, so as to get out of the rut he seems to be in and find a market for his acquired skill.

We find cases where a man has acquired skill at his duties, but is never again given a chance of promotion because his employer, knowing that he is a good man at his post, will not put a new man there and allow the old one to advance to a higher level. So naturally he is left there and a stranger comes in and takes the higher position that was justly deserved by the old employee. There are many men who get into this rut and fall behind, who would be justified in striking out and leaving behind all old connections. It is a question that they must ponder over and answer for themselves according to their judgment.

I have in mind the case of a man who worked steadily for a firm for eighteen years and had become highly efficient at his duties. He was entirely and absolutely capable of filling the position of foreman, which was open several times during his career at this place, but I do not suppose his employers at any time considered him capable of discharging these duties, and would send to other cities and get a new foreman. This man had gotten into a rut that looked hopeless, but one day a firm heard of him and wired him, asking if he would consider joining them as manager of their business. He became skeptical, thinking that probably he could not make good, as it was such a surprise to think that a chance had come for him to progress and his efficiency had been noted by others rather than his old employers. He accepted this new position and in the years since has been progressing right along, and is thankful that he left the rut at the knock of opportunity.

Forestry Convention, Halifax Sept. 1-4, 1914

Arrangements are well under way for the Sixteenth Annual Convention of the Canadian Forestry Association which is to be held at Halifax, N.S., September 1-4, 1914. The President, Mr. William Power, M.P., the well-known lumberman, of Quebec, and the Vice-President, Mr. F. C. Whitman, also a well-known lumberman, of Annapolis, Nova Scotia, are both taking a keen personal interest in the meeting, and under their direction the Secretary, Mr. James Lawler, of Ottawa, will visit Nova Scotia in the latter part of June to hold a series of preparatory meetings in the different counties.

While the different features of forest protection in Canada will be discussed, special attention will be directed to condition in Nova Scotia and the Maritime Provinces. Timberland in Nova Scotia is owned nearly altogether in fee simple and about half of it in comparatively small blocks of from 200 to 1,000 acres. The other half is owned in comparatively large blocks. A great deal of the country has been cut over and the chief point to be discussed is how to protect and handle these cut-over areas which are not fit for farming, so as to get the best results.

It is expected that the Federal Government and all the provincial governments from Ontario eastward will be represented, and already a number of lumbermen and timber owners in different parts of Canada have signified their intention of attending. Particulars may be had by addressing the secretary.

The Inventor of the Peavey Cant Dog

The Peavey Mfg. Company, Brewer, Me., in a recent letter to the Canada Lumberman, give some interesting information regarding the invention of the "Peavey Cant Dog," a tool which is practically universally used in connection with logging operations. The Peavey Cant Dog, they tell us, was invented by Joseph Peavey in Upper Stillwater, in 1858, or very near that time. A man named Wm. Heald, who had charge of the driving of logs on the Stillwater branch of the Penobscot River, used the first Cant Dog made and his family still have it in their possession. "We have tried to get this Cant Dog, but they will not part with it," says the Peavey Mfg. Company. Mr. Joseph Peavey also invented a number of other useful contrivances, among them the hay press and the stump machine and it is claimed that he also made the first wooden screw, 8-in. in diameter, out of beech wood. This screw was used in cider mills and showed very little deterioration after as much as fifty years of use. Mr. Joseph Peavey died at the age of 76.

The Clyde Forks Lumber Company, Clyde Forks, Ont., under date of May 28th, report that their drive is finished and they have all their logs at their mill. We have a better cut than we have had for a number of years.

EDGINGS

Ontario

The East End stave mills belonging to Jas Dogue, at Strathroy, Ont., were recently destroyed by fire at a loss of \$10,000 which was covered by insurance.

Seaman & Sons Company, Limited, Sauble Falls, Ont., have been incorporated with capital stock of \$70,000, to manufacture and deal in lumber, brick and building material.

The planing mill belonging to J. & C. Low, contractors, 262 Catharine street, Ottawa, Ont., was recently destroyed by fire, the loss amounting to about \$60,000. The damage included about \$10,000 worth of machinery, all of which was electrically driven.

Edward Clark & Son Stair Building Toronto, have purchased all the birch, black ash and red oak which the Fassett Lumber Company, Limited, Fassett, P.Q., will turn out this season, amounting to about 3,000,000 feet.

John Foxton's sawmill at Kingston, Ont., was blown up by dynamite on June 1st. Mr. Foxton believes that the destruction was caused by men who had a grudge against him for having obtained a grant in connection with the erection of his mill.

A serious fire broke out at Powasson, Ont., early on the morning of June 7th and resulted in the destruction of 25 buildings. The damage also included 1,000,000 feet of lumber owned by the Trout Creek Lumber Company. Mr. F. A. Bachler, of the Trout Creek Lumber Company, reports that his loss amounts to \$24,000 on which there is insurance of \$12,000.

Eastern Canada

A destructive bush fire which occurred to the east of Oxford Junction, N.S., recently destroyed the mill belonging to Colin McKenzie, at Victoria, N.S. The loss also included 300,000 feet of deals belonging to Wm. Van. Buskirk.

Morrison Bros., sawmill at Karsdale, Lower Granville, N.S., was recently destroyed by a boiler explosion and Mr. Geo. Morrison, the junior member of the firm was seriously injured. It is expected, however, that he will make a steady and satisfactory recovery.

The St. Maurice Lumber Company's mills at La Tuque, P.Q., started their sawing operations on May 11th. With the improved facilities and increased mill equipment which they have installed the company expect to have a much larger production in 1914-15 than ever before.

Operations have been resumed at the Nepisiguit mill of the Bathurst Lumber Company. Many radical changes and improvements have been made in the equipment of this mill and it is now reported to be the most up-to-date of its kind in New Brunswick. Mill No. 1, operated by the Bathurst Lumber Company is employing a full crew of men and the company's new planing mill is rapidly nearing completion.

Another large contract for timber for Government work in eastern Canada is to be placed with British Columbia mills. The amount is 5,500,000 feet, to be used in the construction of the drydock at Port Levis, Que., near Montreal. The contract for the dock was awarded to M. P. and J. T. Davis, who placed the lumber order with Mason, Gordon & Company, Montreal, which latter firm will let the contract to British Columbia mills through its Vancouver office. The lumber will be shipped via Panama.

The lumber mills belonging to R. & T. Ritchie, Aylmer, P.Q., were recently destroyed by fire. The loss amounted to \$75,000 and the insurance was about \$50,000. Mr. Thos. Ritchie is reported as saying that the company will in all probability rebuild the mill. The fire commenced in the shingle mill and spread rapidly to the main body of the sawmill. In addition to the mill, about 50,000 feet of manufactured lumber was destroyed. The destruction of the mill will throw about 125 men out of employment during the summer months. This is the second time that the firm has suffered a heavy loss by fire. In 1911 their lumber yards on the outskirts of Aylmer were destroyed involving a loss of about \$250,000.

Mr. B. L. Moore, Moore's Mills, N.B., whose plant was recently destroyed by fire, reports that he will probably rebuild on somewhat different lines. Formerly his plant was chiefly for the manufacture of wagons and axles. He intends now to go into the manufacture of short lumber, staves, shingles, laths, etc., and to give up the wagon manufacturing end. His new plant will include a rotary saw for long lumber and a grist mill. Mr. Moore also reports that his dams will have to be rebuilt before anything else can be done, so that he will probably not make a start upon erecting the new plant until about August. He will be in the market for machinery.

Western Canada

Three new shingle machines have been installed in the plant of the Port Hammond Lumber Company, Port Hammond, B.C. The new owners of the plant, Messrs. Hartnell & Son are devoting their attention to a general repair

and overhauling of the plant. New booming grounds will be constructed above the present site and storage ground for logs will probably be provided across the river.

The Royal City Lumber & Shingle Company recently lost their shingle mill at New Westminster, B.C., by fire. The loss amounted to \$15,000. The company intend to rebuild. The boiler house and dry kiln were not injured.

P. W. Fauvel, Burnaby, B.C., has awarded a contract for the erection of a shingle mill with a daily capacity of 100,000 shingles. The mill is to be erected at Burnaby Lake and the general contractor is T. P. Morrison, Burnaby, B.C.

The Acorn Lumber Company's mill, Edmonds, B.C., formerly owned by Mr. K. Racey, of Vancouver, has been sold to Mr. M. Irving, formerly in the retail lumber business. Plans are being made for a new dry kiln and additions to the mill.

Georgia Logging Company, of Victoria, a subsidiary company of the Cowichan Lumber Company, Limited, is not operating this season, on account of market conditions. The head office of this concern is at Bobcaygeon, Ontario. Wm. Gidley is the manager of the British Columbia interests.

The Marcum Lumber Company, which has taken over the mill on the Great Northern, south of New Westminster, operated by the Mosher Lumber Company, has for its officers: President, Alexander Cummings; managing director, R. H. Marlatt; secretary-treasurer, J. M. Cummings. The president is a native of Scotland, who after some experience in the West Indies came to Canada, and after being connected with a plant in Vancouver organized the Marcum Lumber Company.

The McCormack & Dailey Lumber Company, which was recently organized at Seattle with a capital of \$50,000, has for its principals men well known in the industry in British Columbia. The president is J. D. McCormack, secretary of the Canadian Western Lumber Company, and who was head of the Columbia River Lumber Company before that plant was taken over by the Canadian Western. The secretary and treasurer is R. A. Dailey, formerly sales manager for the Columbia River Lumber Company at Golden. The sales manager is William Bristow, formerly with Lester W. David & Company, Vancouver.

A report from Prince Albert, Sask., states that the Prince Albert Lumber Company have bought out the Big River Lumber Company and will hereafter operate their plant at Big River and the limits in connection therewith. The sawmill and planing mill of the Big River Lumber Company were destroyed by fire on June 11th, 1913, and the company commenced to re-erect them last fall, expecting to have the planing mill ready in the near future and the sawmill a little later on. The Prince Albert Lumber Company, who are now in possession, anticipate that the planing mill will be completed by July 1st and the sawmill by August 1st. The Big River plant will be closely allied with the other plants operated by the company, but will have a separate organization known as the Ladder Lake Lumber Company Limited notice of whose incorporation was published recently in the Canada Lumberman. Sufficient logs are already cut and ready to keep the new plant operating for almost a year and there is sawn lumber on hand in large quantities ready for the opening of the planing mill. The purchase of this plant also included the purchase of the Big River Lumber Company's timber limits.

Another Forest Protection Association

With a view to prevent forest fires in the Laurentians it is proposed to form an association which will take in hand this important work. At a meeting held in Montreal on June 4th, the following committee to consider the matter was formed: R. A. Outhet, chairman; F. Whittall, secretary; A. Ayres, J. R. Innes Allen (representing the C. P. R.), Guy Tombs (representing the C. N. R.), and Col. Starke. The committee has been asked to draw up a plan for the formation of a society. Mr. James Lawler, of the Canadian Forestry Association, and Mr. Ellwood Wilson, of the Laurentide Company, and vice-president of the St. Maurice Fire Protection Association, were speakers at the meeting, and outlined the methods which are adopted to guard the forests from damage by fire.

New Canada Machinery Bulletins

The Canada Machinery Corporation, Limited, Galt, Ont., have issued a number of new bulletins dealing with some of the principal lines of their product. The new bulletins are to supersede former bulletin and are for insertion in the Canada Machinery Corporation's woodworking machinery catalogue. The new bulletins include the following:—No. 123, Knife Grinder; No. 123, Knife Balancing Machine; No. 505 and No. 507, Mortisers; No. 708, Band Re-saw; No. 817, Box Board Matcher, with continuous feed; No. 903, Three Spindle Vertical Car Borer; No. 905, Three Spindle Vertical Boring Machine; No. 911, Horizontal Boring Machine, with Universal Table; No. 919, Post Borer. These bulletins are attractively published, each of them being illustrated with a good half tone picture of the machine described. The descriptions accompanying the illustrations are brief and practical and give one an excellent idea of the capabilities of each machine.

Utility Wall Board

Interior view of room finished in Utility Board.

Made in five plies with a sheet of asphalt between each ply.

Outside is moisture proofed. You can paint, stain or tint this Wall Board, or it can be covered with paper or burlap.

PULLEYS & SHAFTING

Canada Machinery Corporation

This is Why Millmen Insist on DISSTON SAWS

Here is a steel wedge that was driven into a log and forgotten.

The log in due course arrived at the mill of the Girard Lumber Company, at Dunbar, Wisconsin, U.S.A. This mill is equipped with Disston Saws, and one of these—a 17-gauge, on a Twin Band Mill—while passing through the log, encountered the steel wedge.

It cut clear through the wedge as shown in the illustration, and the filer at this mill reports that the saw lost only 1/32 of an inch as a result of the accident. It took him only one and a half hours to get the saw ready to resume its regular run.

We do **not** claim that a Disston Band Saw will cut metal, but we do claim that when steel meets steel the superior quality and temper of a Disston Saw will triumph every time, for this is only one of many similar incidents.

You can and should "Depend on Disston"
as other mills do in all parts of the world

Look for this brand

SPARTAN

LEATHER BELTING

is the result of extensive chemical researches and the testing of many different tannages of leather.

Where abnormal external conditions exist Spartan Belting should be employed, as the specially tanned leather and the special cement used in its construction resist the injurious effects of water, steam, oil, gas fumes, and heat generated by excessive pulley friction.

For overloaded drives where it is not feasible to get greater power by increasing the belt speed or the width of the pulleys to enable the use of wider belts, recourse should be had to Spartan Belting, remarkable for its pliability and consequently increased pulley grip and its great tensile strength.

In short, Spartan Belting is adapted for use under all abnormal service conditions—particularly suited for use in saw and planing mills. Its use will ensure your plant against transmission troubles, power losses, and shut-downs for repairs.

Spartan Booklet and full details sent upon request. Why not investigate.

When You Overhaul Your Mill

THERE are wet places in every saw and pulp mill where nothing but the highest class belting can "make good." It is for these wet places that we recommend what most mill-men swear by—our

"ACME WATERPROOF" BELT

This belt is especially made for a rough and trying service. It has less stretch than any other belt by 15 to 25 per cent.

When you are overhauling try a Goodhue "Acme Waterproof" belt. Other Goodhue belts are "Extra" and "Standard."

Prices and Particulars on Request.

J. L. Goodhue & Company, Limited

Rutherford's Stock Millwork

KLIMAX

If it's made of wood we can supply it. Our line of stock millwork embraces an immense variety of patterns in doors, newels, mouldings and other trim. Buy from our stock catalogue and you can save money and be sure of prompt shipment.

We are also equipped to cater for special detail work and keep a large plant in operation for this purpose.

The stocks we carry will always be found right up to the minute, and prices will be lower than obtainable elsewhere.

Write us for catalogue.

**Gumming Seven Twenty-Four
Foot Saws a Day and the Wheel
Has Not Glazed or Burned After
Seven Months Use**

Aloxite Saw Gumming Wheels

Are making such records as this
—giving such real saw-gum-
ming results. They cut fast, and
clean—hold their shape—show
long life, and they cut cool with-
out case-hardening the saw.

Let a Trial Wheel show you.

THE CARBORUNDUM COMPANY

PLANTS:

Niagara Falls, N. Y. Manchester, Eng.
Reisholz Düsseldorf, Ger.

STORES:

New York Chicago Boston Cleveland
Philadelphia Cincinnati Milwaukee
Grand Rapids

**Not altogether what we
say but what users say**

"We have used the Alligator or Warping Tug man-
ufactured by you for the last 7 or 8 years, and con-
sider them indispensable to lumbermen on waters of
French River or similar streams."

Will move a bag containing 60,000 logs,
in calm weather, 30,000 in a head wind.

West & Peachey - Simcoe, Ont.

"I Don't Care"

Many belt operatives express this sentiment when we show them their belts are improperly handled, unscientifically managed, and a cause of large money loss which is preventable.

We advocate Cling-Surface treatment and slack running belts and guarantee best results obtainable. Still, after explaining the benefits derivable from slack belts from A to Z, making valuable suggestions, and offering to take no money whatever for Cling-Surface if it doesn't do all we say, many men give little thought and often say, "I don't care. My belts give me a lot of trouble, that's true, but I haven't time to think of them."

The man who Does care uses Cling Surface and it pays him well.

Every managing engineer who is keen as he should be in showing profits from his plant must give all the belting and transmission ropes systematic attention, and Cling-Surface treatment is the one

logical method of constantly maintaining high transmission efficiency and prolonging the life of the whole transmission system.

Where the initial tension is eased by Cling-Surface treatment, shafts, pulleys, hangers, bearings and their mountings are relieved of unnecessary strain, and there is a reduction in internal friction, of repair expense, lubricants and attention that make large annual savings—all due to the action of Cling-Surface.

Put Cling-Surface on just one tight belt for a trial. Select one that has been slipping badly, running off or wearing rapidly, and you will find Cling-Surface highly beneficial. Ask us for examples from plants where Cling-Surface has demonstrated itself to be indispensable. Let us quote f.o.b. Toronto.

DIXON'S Solid Belt Dressing

These handy sticks, containing all the elements needed to keep a belt soft and pliable and adhesive can be rubbed on the belt while running. Their use keeps the belt in a condition of maximum service and longest life—cuts down the belting bill and prevents delays and shut-downs. Send for Booklet No. 238, "The Proper Care of Belts."

WHY you should install the Mahony Blower

System in your Planing Mill

Fifty per cent. higher efficiency than any other on the market to-day, uses $\frac{1}{2}$ less power, costs less to install, no cyclone required, eliminates back pressure on the fan.

I will undertake to increase the capacity of any system now installed 50 to 100% by the application of the Mahony Back Pressure valve on your fan, without using a scrap more of horse-power.

YOU NEED this apparatus in your plant

Write to-day for prices

A. Mahony, 512 Wellington West, Toronto

? Have You an Invention

If so, we can help you to obtain every dollar of its worth.

We possess the expert drafting and mechanical ability; the essential machine shop and equipment for developing practical models; the necessary knowledge for the proper investigation of patent records, etc., and the procedure on obtaining patents that will give you absolute protection.

We obtain and sell patents in every country. Write us for any information you desire.

PLANER &

MATCHER

15" Double Cylinder Planer and Matcher

Our No. 105 machine is a general purpose, medium heavy machine, especially suited for the general planing mill.

The feed range is from 45 to 100 feet per minute. Planes and matches 15" wide by 6" thick.

Full details and description contained in bulletin No. 105, sent on request.

CLYDE IRON WORKS
DULUTH, U. S. A.

Knight

Pony Lath Mill

This mill is built for use with a 10 to 15 horse power engine and as single mill only. It is specially suited to the requirements of thresher and saw mill men operating in small tracts of timber, as both husk and carriage are of a size which will permit of easy loading between the standards of a wagon when moving from one setting to another.

Write for the catalogue of the Knight line of saw mill machinery.

Size "S" Single Mill with 16-foot Carriage

Size Husk	3 feet by 6 feet 3 inches	Width of Carriages	33 inches
Diameter and Length Mandrel	2 3/16 by 55 inches	Trucks	7-inch wheels and 1 1/4-inch axles
Size Drive Pulley	20 by 10 inches	Length Track	32, 40, 48 or 56 feet
Feed per Revolution of Saw	0 to 3 1/4 inches	Style and Opening of Blocks	CI-36 inches
Feed Belt	4-inch Gandy	Style Mill Dogs	Pony Excelsior
Largest Diameter Saw	56 inches	Style Set Works	No. 1 Single Ratchet
Length of Carriages	12, 16, 20 or 24 feet		

With each complete size "S" mill we furnish one saw, wrench, cant hook, feed belt, pulley with boxes for tightener and foundation bolts for husk.

650 Sets Payette's

Famous Patent Mill-Dogs Sold

Why?

- Because (1) They will dog with perfect ease and safety in any class of timber.
 (2) Will dog just as easily, frozen maple or hardwoods of any description.
 (3) Will dog the last board, just as easily as they dogged the first one.
 (4) They do not tear the board or stock.
 (5) Many other reasons, too numerous to mention here.

Write us for full particulars and booklet on same.

We also manufacture the following High-Grade Saw-Mill Machinery;—New Modern Saw-Mill Carriages, with either three or two head blocks; P. Payette's New Patent Saw-Mill Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loaders, Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets, Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

Berlin Surfacers

We have specialized in planing machines for years. Berlin surfacers represent the experience of all these years. You can make no mistake by putting your surfacing requirements up to us. We build surfacers for every purpose. Whatever surfacing you want to do may be done at lowest cost on Berlin.

Are Your Cabinet Surfacers Losing Money For You at the Sander?

Don't depend on your sander to correct the inferior work of your surfacers. That isn't profitable. The inefficiency of one machine is handicapping the other.

Are you thinking of replacing or adding to your present surfacing equipment? Then judge the earning-power of Berlin Surfacers by comparing them with others. Mail your card request for complete data now — so you'll have it for reference when you want it. : : :

Surface your stock on the Berlin "156" Single Cabinet Surfacers. Then once through at the sander will suffice. And instead of sanding two pieces at one time the uniformity of the surfacing will enable your sander operator to feed stock across the entire width of the machine. Its efficiency is increased 100 per cent. That assures profit, absolutely.

Equipped with round heads carrying thin steel knives, which may be ground and jointed on the machine, the "156" produces a finish that shines. Sanding all your stock won't be necessary.

The sturdy construction and the use of only proven design features assures low upkeep cost. There'll be fewer necessary shut downs, less lost time. The top in-feed roll and chip-breaker may be sectional. The wedge method of bed adjustment assures its stability. Fine finish is therefore assured always.

Dominion Timber Regulations

Licenses to cut timber on Dominion Lands in the Provinces of Manitoba, Saskatchewan, and Alberta, the Northwest Territories, within twenty miles on either side of the main line of the Canadian Pacific Railway in the Province of British Columbia, and in the tract of three and one-half million acres to be located by the Government in the Dominion in the Peace River district in the Province of British Columbia, lying east of the Rocky Mountains and adjoining the Province of Alberta, shall be disposed of by public auction at the office of the Dominion Timber Agent for the districts in which the berths are situated.

Before any parcel of timber is offered for sale it shall be surveyed by a duly qualified Dominion Land Surveyor into berths of an area not exceeding twenty-five square miles, and each of such berths shall then be thoroughly cruised by a duly qualified timber cruiser in the employ of the Dominion Government. The Minister shall then fix an upset price at which the berth shall be disposed of, and no berth shall be sold at less than the price so fixed.

Purchases to the amount of one thousand dollars or under shall be paid in cash at the time of sale. Purchases over one thousand dollars and not exceeding five thousand dollars shall be paid, one-half in cash at the time of sale, and a note or notes shall be given for the remaining half of the purchase price, payable in three months, with interest at the rate of five per cent. per annum. Purchases over five thousand dollars and not exceeding ten thousand dollars shall be paid one-third in cash at the time of sale, and notes shall be given for the remaining two-thirds of the purchase price, payable in three and six months, with interest at the rate of five per cent. per annum. Purchases exceeding ten thousand dollars shall be paid one-fourth in cash at time of sale, and notes shall be given for the remaining three-fourths of the purchase price, payable within three, six and nine months, with interest at the rate of five per cent. per annum. Notes shall be made payable at a bank in the city or town in which the sale is held or at a bank in the city of Ottawa. Cash payments must be made at the time of sale in legal tender or by an accepted cheque on a chartered bank, or by a draft issued by a chartered bank, payable to the order of the Deputy Minister of the Interior. If default is made in any payment required by this section the sale shall be forfeited and void.

The purchaser must also pay the cost or the estimated cost of the survey of the berth before a license is issued.

The licensee shall pay an annual ground rent of five dollars per square mile except for lands situated to the west of Yale, in the Province of British Columbia, in which case the yearly ground rent shall be five cents per acre.

The licensee shall pay the following dues on timber cut on his berth :—

Sawn lumber, 50 cents per thousand feet, board measure.

Railway ties, eight feet long, $1\frac{1}{2}$ cents each.

Railway ties, nine feet long, $1\frac{3}{4}$ cents each.

Shingle bolts, 25 cents per cord.

And 5 per cent. on the sale of all other products of the berth.

Timber Permits

Yearly permits are granted to settlers, mine operators and others on application to the Dominion Timber Agents, from whom further information can be obtained.

W. W. Cory,

Deputy Minister.

Department of the Interior, Ottawa,

December 20th, 1912.

Guiding The Mill Man To Larger Profits

Our work consists in helping mill men to increase the quality and volume of material turned out, by furnishing them with **tools which do more and better work with the same labor and power costs.**

The Shimer Cutter Heads of today are the logical product of years of experience and unexcelled facilities for manufacturing them. They offer exceptional advantages for the economical manufacture of Flooring, Ceiling, Siding, Wainscoting, Ship Lap, Door and Sash Patterns, etc. They are designed in sizes, styles and plans to meet any planing mill problem that Cutter Heads can solve.

The Shimer Cutter Heads cut fast and clean because the Bits work with a **divided shearing cut** and have plenty of point and edge clearance. (See diagram.) The Bits are set on the Head in such a manner that only their cutting edges come into contact with the lumber, **preventing friction in the cut** and the consequent heating of the Bits and burning of the lumber.

Each Bit is seated to line up perfectly, presenting self-clearing bit points to make easy the matching of any and every variety of knotty, and cross-grained single tongue and groove flooring. The cutters retain their natural cutting position on the Head and work as well

after years of service as when new.

Consider these points of merit and let us have your order today for such tools as you can use.

Popular Cutter Heads

The most popular of The Shimer Cutter Heads for feeds from 60 to 150 lineal feet a minute are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set ... \$40.95

Price with 6 bits to each head, the set ... 49.27

Price with 8 bits to each head, the set ... 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling— $\frac{3}{8}$ at \$1.05 each and Bits for 2-in. thick plank at \$1.33 each.

Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

The "Shimer Limited" Cutter Heads, with Expansor, Fig. 627 and Fig. 628

For the High Speed Matcher

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new chisel point given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring, \$72.46 the set complete.

Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set, $1\frac{1}{4}$ -in. ... \$31.20

Price, with 4 bits to each head, the set, 2-in. ... 33.28

Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set, $1\frac{1}{2}$ -in. thick ... \$34.84

Price, with 4 bits to each head, the set, $2\frac{1}{2}$ -in. thick ... 35.88

Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

Don't Burn Your Moulding

Blackened edges so often found in hardwood Mouldings indicate the use of inferior tools, which friction and burn because of their failure to have proper clearance.

Shimer Reversible and Non-Reversible Cutters are made of the finest tool steel by experienced workmen. In design and construction they are superior to anything on the market. They cut well and retain their shape until worn out. Send us drawings or wood samples for estimates on special cutters. Many useful designs, with prices, are given in our catalogue.

No Work - No Heat No Lost Motion

*What It Means to Your
Setter*

WITH nothing to tire or distract him the setter can give his undivided attention to the sawyer's signals. He can cut as much at the end of his shift as at the beginning.

TROUT ROPE DRIVEN POWER SETWORKS

Combines a setting and receding mechanism. It operates whether the carriage is stationary or in motion. Two levers only control all operations. No bending or stooping is necessary, the setter standing erect at his work. One shift of the levers will change the set from $1/32$ " to 6" full. The size of logs does not affect the speed or accuracy of the set. The operation is without rack or jar, *lost motion cannot possibly develop*.

The Trout Power Setworks is absolutely self contained, can be attached to any make of carriage and is built for rack or screw knee.

"FROST KING" METAL

\$5,000,000.00

worth of mixed metal
sold annually.

Our thirty five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock this, write us and we will take pleasure in making you a shipment of a 25 lb. box.
